Aaltola, Elisa, Review of: Ingram, David, Green Screen: Environmentalism and Hollywood Cinema. Exeter: University Exeter Press, 2004. Environmental Values 14(2005):539-543.

Aaltola, Elisa, "Other Animal Ethics and the Demand for Difference," Environmental Values 11(2002):193-209. Traditionally animal ethics has criticized the anthropocentric worldview according to which humans differ categorically from the rest of the nature in some morally relevant way. It has claimed that even though there are differences, there are also crucial similarities between humans and animals that make it impossible to draw a categorical distinction between humans who are morally valuable and animals which are not. This argument, according to which animals and humans share common characteristics that lead to moral value, is at the heart of animal ethics. Lately the emphasis on similarity has been under attack. It has been claimed that the search for similarity is itself part of anthropocentric morality, since only those like us are valuable. It also has been claimed that true respect for animals comes from recognizing their difference and "otherness", not from seeing similarities. This paper analyses the new "other animal ethics" by critically examining its basis and consequences. The conclusion is that despite the fact that other animal ethics is right in demanding respect also for difference, it remains both vague and contradictory in its theoretical basis, and leads to undesirable consequences from the perspective of animal welfare. (EV)

Aaltola, Elisa. "Personhood and Animals." Environmental Ethics 30(2008):175-193. A common Western assumption is that animals cannot be persons. Even in animal ethics, the concept of personhood is often avoided. At the same time, many in cognitive ethology argue that animals do have minds, and that animal ethics presents convincing arguments supporting the individual value of animals. Although "animal personhood" may seem to be an absurd notion, more attention needs to be placed on the reasons why animals can or cannot be included in the category of persons. Of three different approaches to personhood—the perfectionist approach, the humanistic approach, and the interactive approach—the third approach is the

strongest. Personhood defined via interaction opens new doors for animal ethics. (EE)

Aaltola, Eliza, "Animal Ethics and Interest Conflicts," Ethics and the Environment 10(no. 1, 2005):19-48. Animal ethics has presented convincing arguments for the individual value of animals. Animals are not only valuable instrumentally or indirectly, but in themselves. Less has been written about interest conflicts between humans and other animals, and the use of animals in practice. The motive of this paper is to analyze different approaches to interest conflicts. It concentrates on six models, which are the rights model, the interest model, the mental complexity model, the special relations model, the multi-criteria model, and the contextual model. Of these, the contextual model is the strongest, and carries clear consequences for the practical use of animals. Aaltola is a researcher in philosophy, Turku University, Finland. (Eth&Env)

Abaidoo, Samuel, Human-Nature Interaction and the Modern Agricultural Regime: Agricultural Practices and Environmental Ethics, 1997, University of Saskatchewan (Canada), Ph.D. thesis in sociology. 305 pages. The relationship between farming practices and two predominant ontological assumptions: (1) the "externality" assumption: humans interact with nature but are only externally related to nature; and (2) the "internality" assumption: humans are internally related to nature. The theoretical orientation is Habermas' neo-modernity thesis, which argues that changes in social normative structures and actions can, and do develop, without changes in ontological assumptions about human-nature relationship. The Habermasian approach rejects the reenchantment thesis espoused by constructive postmodernists. One aspect of the study involved archival research of Canadian agricultural policy; another was a survey of farm families living in the south western Saskatchewan section of the Palliser Triangle. There is a moderate to strong relationship between the "internality" assumption and alternative farming practices. The "externality" assumption was more predominant among conventional farmers. Nevertheless there is only partial support for the Habermasian thesis. A significant minority of alternative farmers espouse environmentalist ethics and also an "externality" ontological assumption. The advisor was H. Dickinson. (v.10,#1)

Abakerli, Stefania, "A Critique of Development and Conservation Policies in Environmentally Sensitive Regions in Brazil," Geoforum (Pergamon): 32(2001):551-565. The current model of protected areas originated in the capitalist U.S., with development on most of the landscape but some protected areas. This has been unsuitably exported to Brazil as a "politically viable rationale." Such protected areas have been implemented by a top-down authority, with no serious attention to the ways in which local peoples' livelihoods were connected with the designated reserves. In English, but the English needs considerable copy-editing. Abakerli lives in Rotterdam, Netherlands. (v.13,#2)

Abbasi, S.A., Krishnakumari, P., Khan, F.I. Hot Topics: Everyday Environmental Concerns. New York, Oxford University Press, 1999. 224 pp. \$14. Abbey, Edward. "Earth First! and The Monkey Wrench Gang." Environmental Ethics 5(1983):94-95. (EE)

Abbey, Ruth, "Rawlsian Resources for Animal Ethics," *Ethics and the Environment* 12(no. 1, 2007):1-22. This article considers what contribution the work of John Rawls can make to questions about animal ethics. It argues that there are more normative resources in A Theory of Justice for a concern with animal welfare than some of Rawls's critics acknowledge. However, the move from *A Theory of Justice* to

Political Liberalism sees a depletion of normative resources in Rawlsian thought for addressing animal ethics. The article concludes by endorsing the implication of *A Theory of Justice* that we look for ways other than rights discourse to respect and protect the well-being of animals. Abbey is at the University of Notre Dame.

Abel, Donald C. Discourses. Customized environmental ethics anthology, under construction. McGraw-Hill has developed an electronic database publication system, called Primis, that enables instructors to create customized anthologies for their courses. Instructors can construct their text and order a free sample copy over the Internet, using the Primis web page: <http://mhhe.com/primis>. The philosophy section is called Discourses, currently with 127 readings. A further set is under construction on environmental ethics. See web page: <http://mhhe.com/primis/phil>. For further information also contact: Donald C. Abel, Philosophy Department, St. Norbert College, 100 Grant St., De Pere, WI 54115. E-mail: abeldc@mail.snc.edu. Phone: 920/403-3086. Fax: 920/403-4086. (v10,#4)

Abel, TD, "Review of: Myers, Norman, and Jennifer Kent, Perverse Subsidies: How Tax Dollars Can Undercut the Environment and the Economy", Society and Natural Resources 15(no.4, 2003):363-364. Abelson, Raziell and Marie-Louise Friquegnon, Ethics for Modern Life, 4th edition. New York: St. Martin's Press, 1991. Chapter 7 is "Environmental Ethics." Readings are Ruth Macklin, "Can Future Generations Correctly be Said To Have Rights?"; Joel Feinberg, "The Rights of Animals and Unborn Generations." (v2,#4)

Abelson, Raziell, and Friquegnon, Marie-Louise, eds., Ethics for Modern Life, 6th edition. Boston: Bedford/St. Martin's, 2003. Contains, on environmental ethics:
-Gore, Al, "The Need for Environmental Protection,"
-Kaufman, Wallace, "The Excesses of Environmentalism,"
and, on animal rights:
-Regan, Tom, "Animals Have Rights,"
-Cigman, Ruth, "Animals Do Not Have Rights,"
-Hof, Christina, "Immoral and Moral Uses of Animals."

Abelson, Raziell and Marie-Louise Friquegnon, eds. Ethics for Modern Life, 5th edition. New York: St. Martin's Press, 1995. 496 pages. Chapter 8 is Environmental Ethics, with two articles: Jan Narveson, "Moral Problems of Population," and Derek Parfit, "On Doing the Best for our Children." Rather strange choices, if there are to be only two articles representing environmental ethics. The editors do not seem to be able to distinguish between environmental ethics and intergenerational ethics. The two 5th edition articles replace Ruth Macklin, "Can Future Generations Correctly be Said to Have Rights?" and Joel Feinberg, "The Rights of Animals and Unborn Generations" in the 4th edition (newsletter v2, #4). Chapter 11 is on animal rights: Peter Singer, "Animal Liberation," and Ruth Cigman, "No Need for Liberation." The suggested reading list is quite inadequate for environmental ethics, mentioning not a single one of the systematic works in the field, and but two of some sixteen anthologies. Abelson is at

New York University; Friquegnon at William Patterson College. (v5,#4)

Abram, David, "The Ecology of Magic," Orion Nature Quarterly, summer 1991. "The traditional shaman ... is in many ways the 'ecologist' of a tribal society. He or she acts as intermediary between the human community and the larger ecological field, regulating the flow of nourishment, not just from the landscape to the human inhabitants, but from the human community back to the local earth. By his or her constant rituals, trances, ecstasies, and 'journeys' the shaman ensures that the relation between human society and the larger society of beings is balanced and reciprocal, and that the village never takes more from the living land than it returns." "Sadly, our society's relation to the living biosphere can in no way be considered a reciprocal or balanced one. ... From an animistic perspective, the clearest source of all this distress, both physical and psychological, lies in the ... violence perpetrated by our civilization; only by alleviating the latter will we be able to heal the former. ... We are human only in contact and conviviality with what is not human. Only in reciprocity with what is Other will we begin to heal ourselves." (v2,#4)

Abram, David, The Spell of the Sensuous: Perception and Language in a More than Human World. Reviewed by James Hatley. Environmental Ethics 19(1997):109-112. (EE)

Abram, David, "Merleau-Ponty and the Voice of the Earth," Environmental Ethics 10(1988):101-120. An important analysis of Merleau-Ponty, showing his relevance to environmental ethics and deep ecology. "[T]he hidden thrust of the phenomenological movement is the reflective rediscovery of our inherence in the body of the Earth" (p. 106). Thus his "work suggests a rigorous way to approach and to speak of the myriad ecosystems without positing our immediate selves outside of them" (p. 119). (Katz, Bibl # 2)

Abram, David. "Nature at Arm's Length." Research in Philosophy and Technology 15 (1995): 177. (v7, #3)

Abram, David. "Merleau-Ponty and the Voice of the Earth." Environmental Ethics 10(1988):101-20. Ecologists and environmental theorists have paid little attention to our direct, sensory experience of the enveloping world. In this paper I discuss the importance of such experience for ecological philosophy. Merleau-Ponty's careful phenomenology of perceptual experience shows perception to be an inherently creative, participatory activity--a sort of conversation, carried on underneath our spoken discourse, between the living body and its world. His later work discloses the character of language itself as a medium born of the body's participation with a world experienced as alive. That living world is none other than the Earth. Abram is in the department of philosophy, State University of New York at Stony Brook, Stony Brook, NY. (EE)

Abram, David. The Spell of the Sensuous: Perception and Language in a More-than-Human World. New York: Pantheon Books, 1996. 333 pages. \$25.00 cloth. "Nobody writes about the ecological depths of the human and more-than-human world with more love and lyrical sensitivity than David Abram" (Theodore Roszak). A sleight-of-hand magician as well as a philosopher, Abram has lived and traded magic with indigenous magicians on several continents. Starting from the intimate relation between these practitioners and the animals, plants, and natural elements, his book draws the reader into investigations regarding the fluid, participatory nature of perception, and the reciprocity between our senses and the sensuous earth. This unfolds into an exploration of language, and the power words have to enhance or to stifle the spontaneous life of the senses. Our most cherished human attributes--from the gift of language, to the awareness of past and future, to the rational intellect itself--all emerge in interaction with the animate natural world, and remain wholly dependent upon that living world for their coherence.

"I know of no work more valuable for shifting our thinking and feeling about the place of humans in the world. Your children and their children will be grateful to him; the planet itself must be glad"--James Hillman, psychologist). "Scholars will doubtless recognize its brilliance, but they may overlook the most important part of Abram's achievement: he has written the best instruction manual yet for becoming fully human. I walked outside when I was done and the world was a different place" (Bill McKibben). "A masterpiece--combining poetic passion with intellectual rigor and daring. Electric with energy, it offers us a new model of scholarly inquiry: as a fully embodied human animal. It opens pathways and vistas that will be fruitfully explored for years, indeed for generations, to come" (Joanna Macy, deep ecology activist). Abram is an ecologist and philosopher, with a PhD from SUNY, Stony Brook. (v6,#4)

Abram, David. "Between the Body and the Breathing Earth: A Reply to Ted Toadvine." Environmental Ethics 27 (2005):171-190. I take issue with several themes in Ted Toadvine's lively paper, "Limits of the Flesh," suggesting that he has significantly misread many of the arguments in The Spell of the Sensuous. I first engage his contention that I disparage reflection and denigrate the written word. Then I take up the assertion that I exclude the symbolic dimension of experience from my account, and indeed that I seek to eliminate the symbolic from our interactions with others. Finally, I refute his claim that my ecophenomenological stance leaves no room for resistance, contradiction, and alterity—elements that are, in fact, central to my understanding of ethics. My reply leads directly into a discussion of one of the crucial concerns of my work: the manner in which the very style of our discourse—our way of wielding words—tacitly works to either enhance, or to stifle, the solidarity between the human community and the more-than-human earth. (EE)

Acampora, Ralph R., "Using and Abusing Nietzsche for Environmental Ethics." Environmental Ethics 16(1994):187-194. Max Hallman has put forward an interpretation of Nietzsche's philosophy according to which Nietzsche is a prototypical deep ecologist. In reply, I dispute Hallman's main interpretive claim as well as its ethical and exegetical corollaries. I hold that Nietzsche is not a "biospheric egalitarian," but rather an aristocratically individualistic "high humanist." A consistently naturalistic transcendentalist, Nietzsche does submit a critique of modernity's Christian-inflected anthropocentrism (pace Hallman), and yet—in his later work—he endorses exploitation in the quest for nobility (contra Hallman). I conclude that ecophilosophers need to exercise hermeneutical caution in any attempt to appropriate Nietzsche for environmentally ethical designs, lest they illegitimately ventriloquize their own moral voices into an authoritative but alien mouthpiece. Acampora is in philosophy, Emory University, Atlanta. (EE)

Acampora, Ralph R. *Corporal Compassion: Animal Ethics and Philosophy of Body*. Pittsburgh: University of Pittsburgh Press, 2006. Acampora critiques analytic approaches to animal rights and animal liberation and uses deconstruction, existentialism, hermeneutics, and phenomenology to develop an interspecies ethos and an animal ethic based on a philosophy of body that emphasizes the phenomenal and somatic commonality of living beings. He discusses practical applications such as animal experimentation and zoological exhibition and challenges animal practitioners to go beyond reform ethics, exploitation, and total noninterference toward a posthumanist culture of caring in a participatory manner.

Achterberg, Wouter, Samenleving, Natuur en Duurzaamheid: Een Inleiding in de Milieufilosofie (Society, Nature and Sustainability: An Introduction to Environmental Philosophy). Assen, Netherlands: Van Gorcum, 1994. Achterberg provides a philosophical analysis of the environmental problematique from a social philosophical and ethical perspective. The book is primarily intended for use by students in environmental philosophy at universities and colleges, but can be of help to anyone interested in the environmental issues. Leading questions are 1) why our society seems to be inherently unable to utilize the environment in a sustainable way and 2) what structural changes can and should be made to change the current unsustainable utilization of the environment. Chapters include: 1) What is environmental philosophy? 2) Sustainability. History and analysis of the idea; 3) Whose environment? Tragedies and dilemmas? 4) Market economy, capitalism and the pressure to grow; 5) State and environmental crisis; 6) Environmental crisis and technology; 7) Attitudes towards nature, 8) Environmental Ethics: Respect for nature and intrinsic worth; 9) Environmental Ethics: Future generations. The book is comprehensive, provides an in-depth analysis of central concepts, positions and theoretical perspectives and offers valuable suggestions for structural change. It is recommended for anyone with a good command of the Dutch language. Achterberg teaches philosophy at the University of Amsterdam and is the ISEE contact for Europe.

Ackerman, Diane. A Slender Thread. New York: Random House, 1997. A meditation on the interconnection of the human and natural worlds. The form is a quasi-journal that blends her observations on nature, as seen through Ackerman's garden windows, with her observations on human nature, as seen through her volunteer work at a local crisis center. Ackerman is also the author of The Rarest of the Rare, a look at endangered species, and A Natural History of the Senses, an effort to catch emotion and sensory beauty in words. (v8,#1)

Ackerman, Frank. Why Do We Recycle? Markets, Values, and Public Policy. Washington, D.C.: Island Press, 1997. 180pp. \$29.95 cloth, \$16.95 paper. A blend of the economic and environmental arguments for recycling and waste reduction. (v8,#1)

Ackerman, Frank. Why Do We Recycle?: Markets, Values, and Public Policy. Washington, D.C.: Island Press, 1996. 180 pages. \$29.95 cloth, \$16.95 paper. The arguments for and against recycling, focusing on the debate surrounding the use of economic mechanisms to determine the value of recycling. Ackerman presents an alternative view of the theory of market incentives, challenging the notion that setting appropriate prices and allowing unfettered competition will result in the most efficient level of recycling. (v7, #3)

Ackland, Len, Making a Real Killing: Rocky Flats and the Nuclear West. Albuquerque: University of New Mexico Press, 1999. 308 pages. Rocky Flats, just outside Denver, Colorado, was a manufacturing site for hockey-puck sized cores, made of plutonium, that detonate nuclear weapons. The plant was built and operated before we knew how to handle nuclear wastes and the managers were under intense pressure to produce at break-neck speed to keep up with what it was presumed the Russians were doing, all under a veil of secrecy, which put the public at great risks they knew nothing about. Now these mistakes leave as legacy one of the worst pollution problems in the U.S., costing tens of millions of dollars each year, and difficult if not impossible to clean up. (v.12,#2)

Adam, Barbara. "Food for Thought: Timescapes of Risk." Environmental Values 8(1999):219-238. ABSTRACT: This paper explores the temporal dimension of risks associated with the production, trade and consumption of food. The paper operates at many levels of substantive and theoretical analysis: it focuses on problems for understanding and action that arise from the invisibility of the hazards, explores the effects of those hazards on consumers and sets out the differences in risks that are faced by farmers, processors, traders and consumers. With its emphasis on that which tends to be disattended in conventional social science analysis - the temporal and the invisible - the paper has implications for social theory at the level of ontology and epistemology. It concludes with reflections on the role of social theory

in such contemporary timescapes of risk. KEYWORDS: Timescape, risk, innovative technology, food, invisible hazards. Barbara Adam, School of Social Science Cardiff University 50 Park Place, Cardiff CF1 3AT, UK (EV)

Adams, Alexis, interviews Bill McKibben, "Dream a Little Dream," The Sun, October 2006, pp. 4-13. "We've been building this [environmental] movement for the last 150 years, and it has accomplished marvelous things: the conservation of wilderness; the reduction of pollution in the air and the water. But the movement isn't nearly big enough and strong enough to handle global warming, because climate change arises from the use of fossil fuels, which are at the heart of pretty much every part of modern life. A problem of this size can be tackled only with enormous changes in technology, in the economy, in our behavior, and in our very idea of who we are." "We know now that in terms of human rights, environmental damage, and almost any measure you can name, the endless-growth model has turned out to be a lousy idea." McKibben wants to replace "sustainability" with "durability."

Adams, Jane, "Class: an Essential Aspect of Watershed Planning," Journal of Agricultural and Environmental Ethics 18(2005):533-556. A study of a watershed planning process in the Cache River Watershed in southern Illinois revealed that class divisions, based on property ownership, underlay key conflicts over land use and decision-making relevant to resource use. A class analysis of the region indicates that the planning process served to endorse and solidify the locally-dominant theory that landownership confers the right to govern. This obscured the class differences between large full-time farmers and small-holders whose livelihood depends on non-farm labor. These two groups generally opposed one another regarding wetland drainage. Their common identity as property owner consolidated the power wielded locally by large farmers. It also provided an instrument - the planning document - for state and federal government agencies to enhance their power and to bring resources to the region. Keywords Cache River - class - deliberative democracy - Southern Illinois - watershed planning Adams is in history, Southern Illinois University, Carbondale. (JAEE)

Adams, John, "The Emperor's Old Clothes: The Curious Comeback of Cost-benefit Analysis." Environmental Values Vol.2 No.3(1993) 247-260. ABSTRACT: Cost-benefit analysis is enjoying a

resurgence. Despite its well documented failures in the past to cope with the environmental damage caused by major transport projects, and despite lack of progress in resolving the causes of these failures, Britain's Department of the Environment now proposes to apply it not just to projects, but to the formulation of policy. Curious. KEYWORDS: Cost-benefit analysis, valuation, willingness to pay, willingness to accept. Department of Geography, University College, London, 26 Bedford Way, London WC1H 0AP, UK.

Adams, Jonathan, *The Future of the Wild: Radical Conservation for a Crowded World*. Boston: Beacon Press, 2005. Parks and protected areas are the cornerstone of conservation in a crowded world, but increasingly we have to worry about borders. Park and wilderness boundaries are artificial, drawn for political and social convenience rather than for ecosystemic reasons, illusory to all but humans. Conservation needs to be integrated across the landscape. Adams is a Nature Conservancy biologist. Adams, Jonathan. *The Future of the Wild: Radical Conservation for a Crowded World*. Boston: Beacon Press, 2006. Adams, with the Nature Conservancy, argues that most conservation needs to be on private lands, since the government-preserved areas are but a fraction of the landscape. He advocates creating a world where farmers, ranchers, loggers, and other intensive users of the landscape participate in a civil community conversation about resources, where the continent's surviving megaflora are allowed to return and roam unmolested among the corridors on private land that connect core conservation areas. One of his examples is Arizona rancher Warner Glenn, a lion hunter, who put down his gun and took the first photograph of a jaguar in the United States, and is now a lion hunter and jaguar (and lion) conservationist.

Adams, Rod D., Liberal Education and the Environment: An Analysis of David Orr's Green Proposal for Higher Education. M.A. thesis, Colorado State University, Fall 2003. Liberal education, David Orr argues, has been equipping students with industrial minds and proposes educating for ecologically literate minds instead. I examine his proposal in the light of the history of liberal education, which has two competing traditions, the rhetorical and the philosophical. Universities tend to emphasize one or the other at various times; a better education would enable students to make their own choices here. Orr requires ideals from both traditions, as well as elements from ancient, modern, and postmodern philosophy. (v.14, #4)

Adams, W. M., Wasting the Rain: Rivers, People, and Planning in Africa. Minneapolis: University of Minnesota Press, 1993. Co-published with Earthscan in the United Kingdom. 240 pages. \$ 17.95, paper. For much of Africa, drought seems to be a permanent feature. Many attempts have been made to develop water resources through dams and irrigation schemes, but these have almost invariably failed. The best hope of appropriate development lies in working with local people using local knowledge. Adams wants to use the strength and diversity of indigenous water development in the difficult and often variable climate of Africa. The record of the modern, large-scale developments, particularly dams and irrigation schemes, has been poor and ineffective in conservation. (v4,#2)

Adamson, Tim, "Measure for Measure: The Reliance of Human Knowledge on the Things of the World," Ethics and the Environment 10(no. 2, 2005):175-194. The notion that all knowledge is a form of measurement can be traced back to the Socratic insight that knowledge requires the presence of some standard against which things are measured. If experience and knowledge rely on some capacity for measurement, what is measurement and what does it entail. The most common contemporary answer to this question can be found in the notion that our experience and knowledge are "constructed" by distinctly human, that is, cultural factors. This raises the question of the place and role of nature in our experience. My aim is to articulate a view of the measurement involved in human experience and knowledge, one which helps us to overcome the privileging of culture over nature that still plagues contemporary thought. My account is inspired by Merleau-Ponty's philosophy of the body, particularly his notion that the human body serves as a "measurant of things." Adamson is in philosophy at Iowa Wesleyan College and Adjunct Professor of Religion at the University of Iowa. (Eth&Env)

Adede, Andronico O., "The Treaty System from Stockholm (1972) to Rio de Janeiro (1992)," Pace Environmental Law Review 13 (no. 1, 1995):33-48. A "new breed" of treaty began to appear in this period, which tries to incorporate new concepts and concerns aimed at bringing about sustainable development. These include inter-generational equity, common but differentiated responsibility, caution against allowing a lack of scientific evidence to serve as a pretext for inaction, the polluter-pays principle, duties of co-operation and exchange of scientific information, trade and the environment, sovereignty and the environment, and the role of non-governmental organizations and local communities in the negotiation and implementation of environmental treaties. Above all, the "new breed" of treaties address, in greater detail, arrangements for both the transfer of funds to combat environmental problems and the transfer of environmentally sound technologies. Furthermore, they take into account the interest of developing countries to ensure their participation in both the negotiation and governance of such treaties. Adede is with the Office of Legal Affairs, United Nations, New York. (v8,#2)

Adelaja, Adesoji & Derr, Donn, & Rose-Tank, Karen, "Economic and Equity Implications of Land-Use Zoning in Suburban Agriculture", Journal of Agricultural Ethics 2(1989):97-112. A cash-flow viability model is used to evaluate the impacts of land-use zoning on farm households in New Jersey. Findings suggest that zoning results in increased production expenses, lower efficiency and profitability and the devaluation of land assets. The results suggest that the use of land-use zoning statutes to guarantee the existence of agriculture may not be equitable unless transferable development rights or other methods of compensating farmers for their losses are simultaneously implemented. Adelaja, Derr, Rose-Tank are in agricultural economics and marketing at Rutgers State University, New Jersey.

Adelaja, Adesoji O. and Brumfield, Robin, "Research Note on Equity and Ethics in State-Promotion of Agricultural Products", Journal of Agricultural and Environmental Ethics 4(1991):82-88. Many state governments in the United States promote locally-produced farm products. This paper discusses issues related to the ethics and equity of such promotional programs. The paper argues that generic promotion is generally easier to justify in terms of ethics and equity than brand promotion. It also argues that informative and factual brand promotions are easier to justify than deceptive and persuasive brand promotions. Additional equity issues arising when taxpayers finance state-promotional programs are also discussed.

Adger, Neil and Katrina Brown, Land Use and the Causes of Global Warming. New York: John Wiley, 1995. 271 pages. \$ 54.95. £ 37.50. The scientific and policy debate concerning the roles of agriculture, forestry and other activities. How land use produces the greenhouse effect; emissions rates; uncertainties

in estimating both the fluxes and the scale of land use change. All land use policies are multi-objective but the reduction of greenhouse gas emissions must be a key element in forestry and agriculture policy on a global basis. The authors are at the University of East Anglia. (v6,#4)

Adger, W. Neil, et al., "Social-Ecological Resilience to Coastal Disasters," Science 309(12 August):1036-1039. Almost as if prescient, Science devoted a theme issue in mid-August to "Dealing with Disasters." Half a dozen articles similar to the above. Predictably, many of the sorts of preparations for response recommended here were missing when Katrina hit two weeks later. A frequent theme is social networking, distributed infrastructure that absorbs hits in one region by resilience in another. Another theme is that disasters will inevitably come, storms, fires, droughts are part of the natural order. These will have increasing impact with larger populations, concentrating nearer coastlines and with global warming. The best management strategy is not the command and control of nature, not rebuilding nature, but a social structure that can roll with the punches, absorbing fire, flood, earthquakes.

Adger, W. Neil, Jouni Paavola, Seleemul Huq, and M. J. Mace, eds. *Fairness in Adaptation to Climate Change*. Cambridge, MA: The MIT Press, 2006. All countries will be endangered by climate change risks from flood, drought, and other extreme weather events, but developing countries are more dependent on climate-sensitive livelihoods such as farming and fishing and hence are more vulnerable. Despite this, the concerns of developing countries are marginalized in climate policy decisions.

Adler, Matthew D., and Posner, Eric A., "Rethinking Cost-Benefit Analysis," The Yale Law Journal 109(1999):165-247. A book-length article. CBA is a useful decision procedure and it should be routinely used by agencies. CBA is superior to rival methodologies. It allows agencies to take into account all relevant influences on overall well-being, unlike simpler decision procedures such as risk-risk; and it enables agencies to weigh the advantages and disadvantages of projects in a clear and systematic way, unlike more complex decision procedures.

However, CBA serves these useful purposes only under certain conditions. First, CBA must give

way to important nonwelfarist concerns, such as deontological rights. Second, CBA must give way when the endowments of affected people vary a great deal. Third, CBA may need to be adjusted to account for uninformed or distorted preferences. Interestingly, agencies already seem to depart from textbook CBA in order to respond to these concerns. Adler is in law, University of Pennsylvania. Posner is in law, University of Chicago.

Adler, Robert W., "Addressing Barriers to Watershed Protection", Environmental Law, 25(No.4, 1995):973- . A comprehensive review of the history of watershed programs in the United States and discusses the underlying issues preventing those programs from succeeding. Recognizing the need for comprehensive watershed-based protections, Adler concludes with a thorough analysis of recommendations for future watershed programs. (v7,#1)

These political movements are motivated by a deep religious commitment. Adriance is in sociology at Mount Ida College. (v6,#4)

Afeissa, Hicham-Stéphane, ed. and trans. *Éthique de l'environnement: Nature, valeur, respect*. Paris: Librairie Philosophique J. Vrin, 2007. This anthology in French contains many of the major classical sources originally in English, including Thomas Birch, J. Baird Callicott, Kenneth Goodpaster, Eric Katz, Arne Naess, Bryan Norton, Holmes Rolston III, Richard Routley, Christopher Stone, and Paul Taylor. This is a welcome addition to the literature of environmental ethics in French.

Africa - Environment and Wildlife is the best single source of reflective articles, raising the ethical and philosophical issues in conservation for a literate audience. This is a magazine, not a journal, issued six times a year and is a relative newcomer on the African scene. Several examples are summarized in the bibliography below. (v6,#3)

Africa. A bibliography of environmental ethics and conservation in Africa is in the ISEE Newsletter, vol. 6, no. 3. Fall 1995.

African Journal of Ecology. The, a scientific journal, is also published by the East African Wildlife Society through Blackwells. (Africa) (v6,#3)

African National Congress, Mayibuye iAfrika--An Introduction to ANC Environmental Policy. Johannesburg, African National Congress, 1991. (v6,#3)

African Panorama, a general magazine, issued a Special Environmental Edition, 1995. Twenty authors have brief articles on values and issues in conversation. Ian Player discusses the importance of the environment to the psyche of humankind. Dawie de Villiers presents the position of the new government on environmental strategies, David Varty examines ecotourism, Carrie Curzon the illegal wildlife trade, George Hughes reports on the eighth CITES conference and South Africa's position there, Nolly Zaloumis outlines threats to wetlands, Tony Pooley examines South Coast degradation, Gerhard Verdoom

describes the battle to save raptors, Basie Maartens explains how hunting can conserve wildlife, Clive Walker explains the importance of creating awareness in children, Raymond Byrne looks at waste facilities, Kader Asmal describes the water supply limitations, Kraai van Niekerk looks at the uneasy relation between farming and conservation, Jeunesse Searll shows how poverty is depleting Africa's natural forests, John Hanks presents opportunities for private sector ecotourism, and more. (v6,#3)

African Wildlife is the official organ of the Wildlife Society, a conservationist organization with general membership. Articles can be good, though not as explicitly probing as those in Africa - Environment and Wildlife. (v6,#3)

Agar, Nicholas, "Biocentrism and the Concept of Life," Ethics 108(1997):147-168. "I have sought to show that our entrenched apparently anthropocentric moral views can take us some distance into nature. The representational account of life (developed in this article) acts as a bridge between living things and value-anchoring psychological notions (such as suffering pains and pleasures). It enables value to be spread very broadly throughout nature. Individual things are not all to be valued equally, however. The amount of value we assign to an individual depends on the range and complexity of goals that an organism is capable of. Why does this type of complexity matter? As organisms have more varied and numerous goals they tend to become more folk psychological. Folk psychological notions in turn have the closest association with relevant normative notions. Thus the life-representational ethic both acknowledges the preeminent place of humans on this planet and spreads value broadly enough to provide firm foundations for an environmental ethic." "Consciousness does not occupy such an important place in the life representational ethic. Many nonconscious organisms will be morally valuable. However, ... consciousness will open up novel varieties of goal to an organism" (p. 168). Agar is in philosophy, Victoria University of Wellington, New Zealand. (v9,#1)

Agar, Nicholas, Life's Intrinsic Value: Science, Ethics, and Nature. New York: Columbia University Press, 2001. Anything living is intrinsically valuable, from the bacteriophage T4 to humans. A biocentric ethic forms the platform for an ethic of the environment. Just as physical science once dislodged humans from the center of the universe, biological science challenges the received wisdom that only humans are valuable in themselves. Analysis of historic and contemporary views from Aristotle and Kant to E. O. Wilson, Peter Singer, Holmes Rolston III, Michael Ruse, and J. Baird Callicott.

Some chapter titles and themes: The psychological view of intrinsic value. Defining intrinsic value. Why are humans morally special? Scientific facts and values. The limits of ethical extensionism and beyond. Two types of natural kinds overlap. Combining the overlap of descriptive and metaphysical kind to unearth environmental value. Recent defenses of biocentrism. A morally specialized account of life. Commonsense and customized accounts of life. A biofunctional explanation of self-movement. Why the representationally alive are morally important. The teleological account of contents in biopreferences. The threat of genic selectionism. Sentience and goals. The shortcomings of individualism. Environmental value holism. Individualistic ethics of species and ecosystems. An impossible ethic? Does life value leave room for human lives? A call for a scientifically informed appreciation of nature. Agar is in philosophy, Victoria University, Wellington, New Zealand. (v.12,#2)

Agar, Nicholas. "Valuing Species and Valuing Individuals." Environmental Ethics 17(1995):397-415. My goal in this paper is to account for the value of species in terms of the value of individual organisms that make them up. Many authors have pointed to an apparent conflict between a species preservationist ethic and moral theories that place value on individuals. I argue for an account of the worth of individual organisms grounded in the representational goals of those organisms. I claim that this account leads to an acceptably extensive species preservationist ethic. Agar is in the department of philosophy, Victoria University of Wellington, New Zealand. (EE)

Agrawal, Arun, "Environmentality: Community, Intimate Government, and the Making of Environmental Subjects in Kumaon, India," Current Anthropology 46(no. 2, April 2005):161 -). How rural Indian residents come to care about the environment. How regulatory strategies resulting from community decision-making help transform those who participate in government. Agrawal is in natural resources and environment at the University of Michigan, Ann Arbor.

Agrawal, Arun. "The Community vs. the Market and the State: Forest Use in Uttarakhand in the Indian Himalayas", Journal of Agricultural and Environmental Ethics 9(1996):1-15. Most writers on resource management presume that local populations, if they act in their self-interest, seldom conserve or protect natural resources without external intervention or privatization. Using the example of forest management by villagers in the Indian Himalayas, this paper argues that rural populations can often use resources sustainably and successfully, even under assumptions of self-interested rationality. Under a set of specified social and environmental conditions, conditions that prevail in large areas of the Himalayas and may also exist in other mountain regions, community institutions are more efficient in managing resources than either private individuals or the central government. In advancing this argument, the paper undermines the often dogmatic belief in the universal superiority of private forms of ownership and management. Keywords: common property, resource management, forests, Himalayas, Uttarakhand, collective action, institutions, new institutionalism. Agrawal teaches political science at the University of Florida. Aguera-Cabo (Agüera-Cabo), Mercè, "Gender, Values and Power in Local Environmental Conflicts: The Case of Grassroots Organisations in North Catalonia," Environmental Values 15(2006): 479-504. Not much attention has been paid to gender in environmental management and decision-making. This article explores how a gender dimension can contribute to the environmental debate by means of a comparative study of three environmental grassroots organisations in the North of Catalonia (Spain). The study shows that gender is significant for distinguishing different priorities between women and men in local conflicts and in environmental interests in general. The analysis of unequal power relations between genders in grassroots organisations leads us to discuss how women have fewer opportunities to influence the environmental debate and to advance their ideas. The concluding thoughts stress the need for developing a gender dimension in environmental management and decision-making, considering the opportunities that are presented by emerging governance practices, and particularly by participatory processes. Airaksinen, Timo, "Original Populations and Environmental Rights." Journal of Applied Philosophy 5 (1988): 37-47. Do indigenous populations have the right to maintain destructive environmental practices? The argument here suggests that original populations are part of natural environmental equilibria, and that if nature has intrinsic value, then the original population acquires strong rights to continue its way of life. Implying the necessity for compensation and the sharing of political power, this strong right to use the environment contrasts with policies of preservation. (Katz, Bibl # 2)

Aitken, Gill, "Conservation and Individual Worth," Environmental Values 6(1997):439-454.

ABSTRACT: It is commonly supposed that individual animals are of little relevance to conservation which is concerned, instead, with groups of things or wholes such as species, habitats, and the like. It is further contended by some that by prioritising individuals, two of those values that are held dear by conservation--namely natural selection and fitness--are compromised. Taking wildlife rehabilitation as a paradigm case of concern for the individual, it is argued that the latter claim is based upon mistaken assumptions. Then, using red deer culling as a case study, the discord between conservation's holistic values and a concern for individual worth is explored. It emerges that the conservation value of red deer culling is more apparent than real and thus that there is more room for conservationists acceptance of individual worth than usually supposed. Aitken, Gill, A New Approach to Conservation: The Importance of the Individual through Wildlife Rehabilitation. Aldershot: Ashgate, 2004. Reviewed by Helena Siipi in Environmental Values 14(2005):527-529.

Aitken, Gill, "Animal Suffering: An Evolutionary Approach," *Environmental Values* 17(2008): 165-180. Though much is written about animal suffering, little is said about the nature of suffering itself. Without any clarity about its conceptual nature, discussions concerning detection, prevention and reduction of suffering are seriously hampered. This paper considers - and rejects - some of the more usual understandings of suffering (such as that suffering is synonymous with either pain or negative emotions). Instead, an alternative understanding of suffering is proposed, namely that suffering is the experiencing of one's life as going badly. This notion is tied to the loss of individuals' central life projects. It is suggested that non-human animals' central projects are their evolved survival skills. This alternative view of suffering has major implications for animal welfare.

Akama, John S., Lant, Christopher L., and Burnett, G. Wesley. "Conflicting Attitudes Toward State Wildlife Conservation Programs in Kenya," Society and Natural Resources 8(no.2, Mar.1995):133- . (v6,#4)

Akama, John S., Lant, Christopher L., Burnett, G. Wesley. "A Political-Ecology Approach to Wildlife Conservation in Kenya," Environmental Values 5(1996):335-347. Kenya has one of the highest remaining concentrations of tropical savanna wildlife in the world. It has been recognized by the state and international community as a unique world heritage which should be preserved for posterity. However, the wildlife conservation efforts of the Kenya government confront complex and often persistent social and ecological problems, including land-use conflicts between the local people and wildlife, local peoples' suspicions and hostilities toward state policies of wildlife conservation, and accelerated destruction of wildlife habitats. This essay uses a political-ecological framework in the analysis of the social factors of wildlife conservation in Kenya. It postulates that the overriding socioeconomic issue impacting wildlife conservation in Kenya is underdevelopment. The problem of underdevelopment is manifested in forms of increasing levels of poverty, famine and malnutrition. The long term survival of Kenya's wildlife depends on social and ecological solutions to the problems of underdevelopment. KEYWORDS: Political-ecology, wildlife, underdevelopment, national park, conservation. (EV)

Akerman, Maria, "What Does 'Natural Capital' Do? The Role of Metaphor in Economic Understanding of the Environment," Environmental Values 12(2003): 431-448. At the time of its introduction in the end of the 1980s, the concept of natural capital represented new, more ecologically aware thinking in economics. As a symbol of novel thinking, the metaphor of natural capital stimulated a debate between different disciplinary traditions on the definitions of the concept and research priorities and methods. The concept became a means to control the discourse of sustainable development. In this paper, I focus on the power/knowledge implications of the use of the concept, and I follow the career of the concept of natural capital in ecological economic publications between the years 1988 and 2000. The main interests are (1) in the use of the concept to affect the rules according to which claims concerning sustainable development can be made and (2) in the constitution of objects of environmental knowledge. Akimoto, Hajime, "Global Air Quality and Pollution," Science 302(5 December 2003):1716-1719. Intercontinental transport and hemispheric air pollution by ozone jeopardize agricultural and natural ecosystems worldwide and have a strong effect on climate. Aerosols are spread globally but have a strong regional imbalance. In the 1990's nitrogen oxide emissions from Asia surpassed those from North America and Europe and should continue to exceed them for decades. International initiatives to mitigate global air pollution require participation from both developed and developing countries. Akimoto is a global change researcher, Yokohama, Japan.

Akkerman, Abraham, "Urban planning in the founding of Cartesian thought," Philosophy and Geography 4 (No. 2, 2001): 141-167. It is a matter of tacit consensus that rationalist adeptness in urban planning

traces its foundations to the philosophy of the Renaissance thinker and mathematician René Descartes. This study suggests, in turn, that the planned urban environment of the Renaissance may have also led Descartes, and his intellectual peers, to tenets that became the foundations of modern philosophy and science. The geometric street pattern of the late middle ages and the Renaissance, the planned townscapes, street views and the formal garden design, appeared as parables for the perfection of the universe and the supremacy of critical reason. It is within this urban metaphor that Descartes' account betrays perceptual and conceptual impact from the contrast between convoluted medieval townscapes and the emerging harmonious street patterns where defined vistas and predictable clarity of street views were paramount. The geometrically delineated street views of the Renaissance new town became the spark that lit the philosopher's sagacity in reflecting upon the concept of 'clear and distinct ideas'. Past suggestions that Descartes was led to his philosophical breakthroughs through his discovery of co-ordinate geometry reinforce further the stance that Renaissance planning predisposed rationalist thought. Akkerman is Professor of Geography and Director, Regional and Urban Development Program, University of Saskatchewan. (P&G)

Al-Kahem, Hmoud F., "Wildlife Conservation in Saudi Arabia," in Wildlife Conservation and Development in Saudi Arabia, Proceedings of the First Symposium, Riyadh, February 1987, edited by Abdulaziz H. Abu-Zinada, Paul D. Goriup, and Iyad A. Nader, National Commission for Wildlife Conservation and Development, Publication No. 3, Riyadh, 1989. Most people underestimate the merits of wildlife preservation. Often, threats to wildlife are not treated sufficiently seriously. Human encroachment on wildlife habitat can lead to extinction. Threats to Arabian fauna are discussed. Arguments for native species protection are presented. Recommendations for Arabian wildlife preservation are proposed. In English. Al-Kahem is in the Zoology Department, College of Science, King Saud University, P. O. Box 2455, Riyadh 11451, Saudi Arabia. (v1,#4)

Albanese, Catherine L., Nature Religion in America: From the Algonkian Indians to the New Age. University of Chicago Press, 1990. 267 pages, \$ 24.95. Five chapters examine nature as symbolic religious center in the views of the aboriginal Americans and the first Europeans; in the "organic" compact of the Founders; in the Transcendentalists; in the "sectarian healers" of the late 19th century; and finally in several contemporary manifestations. The Amerindians' sense of themselves as a part of nature contrasts with the Puritan's fears of wilderness. These themes were subsumed, to a degree, by the Freemasons of the early republicans. But when Emerson, Thoreau and John Muir attempted to reconcile these disparate legacies, they only succeeded in transforming them into another conundrum: an Aristotelian belief in nature as "really real" versus a Platonic concept of nature as "ideal" or "illusory." In the course of her survey, Albanese examines several kinds of late 19th century mind cures; herbalists, homeopaths, chiropractors and others preached a kind of Christian physiology teaching that harmony with natural forces was a means to ordering and using those forces for one's own good and the good of society. Einstein and Planck upset the belief in such an order, but the new, fluid science of the 20th century has

produced today "recapitulated pieties" of the nation's beginnings, as in the writings of Annie Dillard. At issue in this ethereal debate was the tangible question of whether human beings were to harmonize with nature or to have mastery over it. Really a set of far-ranging essays more than a narrative account of nature religion in America. Albanese is professor of religious studies at the University of California at Santa Barbara. (v1,#4)

Aldred, Jonathan, "Existence Value, Welfare and Altruism." Environmental Values 3(1994):381-402. Existence Value has become an increasingly important concept as the use of cost benefit analysis has spread from traditional applications to attempts to place monetary value on, for instance, a rare wetland habitat. Environmental economists have generally accepted the tensions arising in existence value concept from the range of recent applications, but it is argued here that their various attempts to resolve the difficulties have largely failed. Critics from outside economics, on the other hand, typically claim that the very notion of existence value as understood in economics is flawed, and urge its abandonment altogether. This paper suggests, instead, a fundamental redefinition of existence value, which, it is argued, (i)explains a number of diverse problems posed by the usual meaning of the term in economics; (ii)does not strain the intentions of respondents to 'willingness-to-pay' surveys; (iii)is consistent with a more realistic model of rational choice in environmental decision-making; and (iv)is sensitive to criticisms from environmental ethics. KEYWORDS: Existence value, contingent valuation method, welfare, commitment, altruism, incommensurable choices. Aldred is at Sidney Sussex College, Cambridge, U.K. (EV)

Aldred, Jonathan, "Cost-Benefit Analysis, Incommensurability and Rough Equality," Environmental Values 11(2002):27-47. A recurring question about cost-benefit analysis (CBA) concerns its scope. CBA is a decision-making method frequently employed in environmental policy-making, in which things which have no market price are treated as if they were commodities. They are given a monetary value, a form of price. But it is widely held that some things cannot be meaningfully priced, thus substantially limiting the scope of CBA. The aim of this paper is to test some aspects of this broad claim, focusing on problems of incomparability and incommensurability. In particular, the role of rough equality as a putative form of comparison is investigated. I argue that while an assessment of the full significance of rough equality for practical decision-making awaits resolution of a number of important technical questions, it does not provide a strong enough form of comparison to support CBA. Alexander, Donald, "Bioregionalism: Science or Sensibility," Environmental Ethics 12(1990):161-173. A criticism of the bioregional movement in environmental philosophy for its unclear and incorrect philosophical and scientific concepts: e.g., definition of bioregion, boundaries of bioregion, and reverence for natural law. Bioregionalism should not be a scientific concept but a cultural sensibility, a social value. Region is a dialectical concept integrating both human and natural parameters. (Katz, Bibl # 2)

Alexander, Donald. "Bioregionalism: Science or Sensibility?" Environmental Ethics 12(1990):161-73. The current interest in bioregionalism, stimulated in part by Kirkpatrick Sale's Dwellers in the Land, shows that people are looking for a form of political praxis which addresses the importance of region. In this paper, I argue that much of the bioregional literature written to date mystifies the concept of region, discounting the role of subjectivity and culture in shaping regional boundaries and veers toward a simplistic view of "nature knows best." Bioregionalism can be rehabilitated, provided we treat it not as a "revealed wisdom" for the reconstruction of human society, but as a sensibility and environmental ethic that can infuse our work even as we make use of the functional regionalisms that increasingly shape people's consciousness. I conclude by citing Lewis Mumford's concept of a region as capturing the dialectical interplay of natural and cultural elements. Alexander is at the School of Urban and Regional Planning, University of Waterloo, Ontario. (EE)

Allan, JD, et al., "Overfishing of Inland Waters," BioScience 55 (no. 12, December 2005): 1041-1051. Inland waters have received slight consideration in recent discussions of the global fisheries crisis, though

they provide much needed protein, jobs, and income, especially in rural communities of developing countries. Systematic overfishing of fresh waters is largely unrecognized because of weak reporting and because fishery declines take place within a complex of other pressures. Moreover, the ecosystem consequences are poorly understood. These complexities underlie the paradox that overexploitation of a fishery may *not* be marked by declines in total yield, even when individual species and long term sustainability are highly threatened. Indeed, one symptom of intense fishing in inland waters is collapse of particular stocks even as overall fish production rises—a biodiversity crisis more than a fisheries crisis.

Allen, Colin and Marc D. Hauser, "Concept Attribution in Nonhuman Animals: Theoretical and Methodological Problems in Ascribing Complex Mental Processes," Philosophy of Science 58(1991):221-240. The demise of behaviorism has made ethologists more willing to ascribe mental states to animals. However, a methodology that can avoid the charge of excessive anthropomorphism is needed. Allen and Hauser describe a series of experiments that could help determine whether the behavior of nonhuman animals towards dead conspecifics is concept mediated. The behavior of some animals is clearly guided by complex mental processes. The techniques developed by comparative psychologists and behavioral ecologists are able to provide us with the tools critically to evaluate hypotheses concerning the continuity between human minds and animal minds. Allen is in the Department of Philosophy at Texas A& M University. Hauser is in the Department of Zoology at the University of California, Davis. (v2,#2)

Allen, Colin; Bekoff, Marc; and Lauder, George, eds. Nature's Purposes: Analyses of Function and Design in Biology. Cambridge, MA: MIT Press, 1998. 603 pages. 22 papers, mostly from philosophy journals. The dogma is that teleology is unscientific, and in some contexts it is, but in other contexts biologists can avoid it only with implausible circumlocution. Long hair on dogs has the purpose (function) of keeping them warm; it does not have the purpose of harboring fleas, though it does both these things well. Some scientists consider teleology a shorthand for phenomena that could be expressed more accurately eliminating it, but others find it the best way to express what they need to say about what is going on in the world. The editors are a philosopher, a student of animal behavior, and a functional morphologist. (v.9,#3)

Allen, John L., ed., Environment 93/94. 12th ed. Guilford, CT: Dushkin Publishing Co., 1993. 243 pages. 32 articles, all drawn from the popular press, debating environmental issues. I. The Global

Environment. II. Population and Hunger. III. Energy. IV. Pollution. V. Resources: Land, Water, and Air. VI. Biosphere: Endangered Species. Articles are easy and short, suitable for freshmen and high school use, but raise issues that are right at the center of the debate. Allen is in geography at the University of Connecticut. (v4,#1)

Allen, John, ed., Environment 90/91. Guilford, CT: Dushkin Publishing Group, 1990. In the annual editions series. Thirty-one reprints of recent magazine feature articles on the environment, for example Time's "What on Earth Are We Doing?" (cover story of their "Planet of the Year" issue), Environment's "The Intertwining of Environmental Problems and Poverty," National Wildlife's "21st Environmental Quality Index: The Planet Strikes Back," Science News', "Where Acids Reign," and "Lessons from the Flames" (Yellowstone fires). Sections on people and hunger; energy; pollution; land, water, and air; and endangered species. Journal articles make easier reading for lower level students in environmental ethics, and they give upper level students opportunity to analyze media coverage of issues. Articles are chosen to be timely, relevant, and provocative. (v1,#2)

Allen, Scott Stetson, Crux Reality: A Climber's Guide to Philosophy. Boulder, CO: Climbing Arts Council, 1992 (875 Alpine Ave., Apt. 22, Boulder, CO 80304-3241). 91 pages. Paper. \$ 5.00. Short introductions to various philosophers--Heidegger, Marcuse, Foucault, Sartre, Marcel, Unamuno, Orta y Gasset--mixed with some thoughts on rock climbing, why, the mind of a climber, and the ethics of climbing. "Heroic modern thinkers and ideas that can provide enlightenment for even the most ridiculous of vertical pursuits." A sample: Nietzsche: "Philosophy, as I have hitherto understood and lived it, is a voluntary living in ice and high mountains--a seeking after everything strange and questionable in existence" (p. 4). Allen has a degree in philosophy from Colorado College, and is now a public schoolteacher. (v4,#4)

Alperovitz, Gar. "Squeezed Out: The Plight of the Middle Class." *Christian Century* Vol. 124, no. 1 (2007): 26-9. This is a critical review of Norton Garfinkle's *The American Dream vs. the Gospel of*

Wealth: The Fight for a Productive Middle-Class Economy (New Haven: Yale University Press, 2006) and Thom Harrington's *Screwed: The Undeclared War Against the Middle Class* (San Francisco: Berrett-Koehler, 2006). Alperovitz himself is the author of *America Beyond Capitalism: Reclaiming our Wealth, Our Liberty and Our Democracy* (Hoboken, NJ: J. Wiley, 2005). "Long-term trends toward relative and absolute inequality have not been, and are unlikely to be, reversed until major changes in the political context occur. Long-term trends of environmental decay also have not been, and are unlikely to be, reversed." Capitalists are equally enthusiastic about exploiting both labor and nature. A major factor is "the enormous economic problems caused by globalization or rather, caused by the way in which corporate and other political elites have dealt with globalization." "The U.S. remains the wealthiest nation in the history of the world," yet "the U.S. is by far the most unequal of all the advanced nations." For wealth ownership: "[A] mere 1 percent owns just under half of all corporate and other productive business wealth. A mere 5 percent owns 70 percent of such wealth." Alperovitz teaches political economy at the University of Maryland.

Alpert, Peter, "Stewardship, Concept Of," Encyclopedia of Biodiversity 5: 481-494. Stewardship is taking care of something for someone else. Originally, a steward was a person who managed household affairs for a landowner. In natural resource management, stewardship often refers to voluntary actions taken by private landowners to promote ecological goals on their own lands. Stewardship may have an instrumental rationale, such as the human need for natural resources; or an intrinsic rationale, such as the moral rights of species to exist. (v.11,#4)

Alpert, Peter. "Integrated Conservation and Development Projects," Bioscience 46(no.11, 1996):845. Examples from Africa. (v8,#1)

Alpert, Peter. "The Boulder and the Sphere: Subjectivity and Implicit Values in Biology." Environmental Values 4(1995):3-15. Science is inherently subjective. The experience of dissertation research in ecology showed how intuitively derived hypotheses and assumptions define the questions one asks and the variables one measures, and how idealised forms and generalised types facilitate analysis but distort interpretation. Because these conceptual tools are indispensable to science, subjectivity is ineluctable. This has moral implications. Scientists are responsible for the particular abstractions they select and must therefore accept some moral responsibility for the way their results are used. Those who use scientific results have an equal responsibility to acknowledge the significance of the methods and not just of the conclusions. In biology, subjectivity may also have a positive side. A wide consensus of ecological biologists accept, on the apparently neutral grounds of accumulated study, a set of generalisations that society at large treats more as philosophical beliefs. This category of implicit values in biology holds much promise for improving our relations with nature and each other. KEYWORDS: biology, values, subjectivity Alpert is in the department of biology, University of Massachusetts. (EV)

Alrøe, Hugo Fjelsted and Erik Steen Kristensen. "Toward a Systemic Ethic: In Search of an Ethical Basis for Sustainability and Precaution." Environmental Ethics 25(2003):59-78. There are many different meanings of sustainability and precaution and no evident connection between the new normative concepts and the traditional moral theories. We seek an ethical basis for sustainability and precaution—a common framework that can serve as a means of resolving the conceptual ambiguities of the new normative concepts and the conflicts between new and traditional moral concepts and theories. We employ a systemic approach to analyze the past and possible future extension of ethics and establish an inclusive framework of ethical extension. This framework forms the basis for what we call a systemic ethic.(EE)

Alroje, Hugo Fjelsted, Mette Vaarst, and Erik Steen Kristensen. "Does Organic Farming Face Distinctive Livestock Welfare Issues? - A Conceptual Analysis." Journal of Agricultural and Environmental Ethics 10(2001): 275-299. The recent development and growth of organic livestock farming and the related development of

national and international regulations has fueled discussions among scientists and philosophers concerning the proper conceptualization of animal welfare. These discussions on livestock welfare in organic farming draw on the conventional discussions and disputes on animal welfare that involve issues such as different definitions of welfare (clinical health, absence of suffering, sum of positive and negative experiences, etc.), the possibility for objective measures of animal welfare, and the acceptable level of welfare. It seems clear that livestock welfare is a value-laden concept and that animal welfare science cannot be made independent of questions of values and ethics. The question investigated here is whether those values that underpin organic farming, in particular, also affect the interpretation of livestock welfare, and, if so, how. While some of the issues raised in connection with organic farming are relatively uncontroversial, others are not. The introduction of organic farming values seems to introduce new criteria for what counts as good animal welfare, as well as a different ethical basis for making moral decisions on welfare. Organic farming embodies distinctive systemic or communitarian ethical ideas and the organic values are connected to a systemic conception of nature, of agriculture, of the farm, and of the animal. The new criteria of welfare are related to concepts such as naturalness, harmony, integrity, and care. While the organic values overlap with those involved in the conventional discussion of animal welfare, some of them suggest a need to set new priorities and to re-conceptualize animal welfare - for example, with respect to "naturalness," in relation to the possibilities for expression of natural behavior and in relation to animal integrity as a concept for organismic harmony. The organic perspective also seems to suggest a wider range of solutions to welfare problems than changes in farm routines or operations on the animals. The systemic solutions include the choice and reproduction of suitable breeds, changes in the farm structure, and changes in the larger production and consumption system - including consumer perceptions and preferences. But the organic values may also call for sacrifices of individual welfare in a conventional sense in order to advance welfare from the perspective of organic farming. Whether this is good or bad cannot be decided without entering into an inquiry and discussion of the values and ethics involved. Keywords: animal welfare, integrity, naturalness, organic farming, systemic perspective. The authors are at the Danish Research Centre for Organic Farming, Foulum, Tjele. (JAEE)

Altner, G., Mettler-Meibom, B., Simonis, U.E. and Weizsäcker, E.U. v, eds. Jahrbuch Okologie. Reviewed by Ingolfer Blüdhorn. Environmental Values 5(1996):90-91. (EV)

Altner, Günter, Naturevergessenheit: Grundlagen einer umfassenden Bioethik (Nature Forgotten: Towards a Comprehensive Bioethic). Darmstadt: Wissenschaftliche Buchgesellschaft, 1991. 319 pages. Hardbound. ISBN 3-534-80043-5. DM 29,80. Altner argues that the prevailing attitude towards nature is disastrously inadequate, resulting in the destruction of nature. We need an all-embracing reverence for life. Altner works through Cartesian subject-object dualism, the bioethics of Singer, Birnbacher, and Schweitzer, bioethics and creation theology, bioethics and evolutionary science, bioethics and technology, and then presents his own comprehensive bioethics. Some of the issues he confronts include domestic animals, meat-eating, animal experimentation, landscapes, energy policy, climate change, gene technology, population control. One touchstone for a bioethic is "the obligation of solidarity with the unborn, the handicapped, and the dying. Whoever is unwilling to protect life of this sort will also be so in

areas more remote from humanity. But a bioethic would be falsely and inadequately fulfilled if the all-embracing respect for life did not reach through humans to their deepest level of obligation. How could non-human nature have a value for us, if we are not aware of it in and through our own human selves" (from the Introduction). Altner holds doctorates in both theology and biology and is professor of theology at the University of Koblenz-Landau and a board member of the Ecological Institute of Freiburg. (v5,#2)

Ames, Roger T. "Taoism and the Nature of Nature." Environmental Ethics 8(1986):317-50. The problems of environmental ethics are so basic that the exploration of an alternative metaphysics or attendant ethical theory is not a sufficiently radical solution. In fact, the assumptions entailed in a definition of systematic philosophy that gives us a tradition of metaphysics might themselves be the source of the current crisis. We might need to revision the responsibilities of the philosopher and think in terms of the artist rather than the "scientific of first principles." Taoism proceeds from art rather than science, and produces an ars contextualis: generalizations drawn from human experience in the most basic processes of making a person, making a community and making a world. This idea of an "aesthetic cosmology" is one basis for redefining the nature of the relatedness that obtains between particular and world--between tao and te. Ames is in the department of philosophy, University of Hawaii at Manoa, Honolulu, HI. (EE)

Anand, Paul. "Decisions vs. Willingness-to-Pay in Social Choice." Environmental Values 9(2000):419-430. Abstract: The paper compares use of willingness to pay values with multi-attribute utility as ways of modelling social choice problems in the environment. A number of reasons for moving away from willingness to pay are reviewed. The view proposed is that social choice is

about the integration of competing claim types (utilities, rights, social contracts and beliefs about due process). However, willingness to pay is only indirectly related to the first of these and assumes an Arrovian approach, namely one in which social choice is regarded as the aggregation of people's preferences. Keywords: Willingness to pay, applied social choice, multi-attribute utility theory, environmental decision making, capability rights. Paul Anand is at The Open University, Milton Keynes, MK7 6AA, UK. (EV)

Andelman, SJ; Bowles, CM; Willig, MR; Waide, RB, "Understanding Environmental Complexity through a Distributed Knowledge Network", BioScience 54 (no.3, 2004): 240-246(7). Understanding environmental complexity and other dimensions of ecological systems necessitates a holistic approach that can be achieved only by identifying, retrieving, and synthesizing diverse data from distributed sources; by collaborating with other scientists from a broad range of disciplines; and by investigating many different systems. Knowledge Network for Biocomplexity (KNB) is developing new software tools to advance ecological understanding through discovery, access, retrieval, and management of distributed and heterogeneous ecological and environmental data. To address the need for cultural change in ecologists and other environmental scientists and to promote collaborative and synthetic approaches, KNB and the National Center for Ecological Analysis and Synthesis are training a cadre of young investigators in techniques for the management and analysis of ecological data, with emphasis on multiscale integration and synthesis.

Anderberg, Thomas. Den Mänskliga Naturen: En Essä om Miljö och Moral (The Humane Nature: An Essay on Environment and Morals). Stockholm: Norstedts Forlag, 1994. 308 pages. ISBN 91-1-932031-0. Chapter themes: Overpopulation, depletion and environmental degradation--biological impoverishment, economic flourishing, common morality: a sketch. Nature as complementary or as fundamental? The two directions in environmental ethics--anthropocentrism and non-anthropocentrism. The widening circle, a global ethics--nature and culture. A model of moral politics. The tamed animal--human nature in a biological perspective. Environment, gene technology and the problem of democracy--the struggle of the majority and the faceless collectives. The nature of morality and the moral of nature--collective guilt and the responsibility of the individual: a compass direction. Anderberg is at the University of Lund, Sweden.

Andersen, Carl Christian, Okofilosofisk Perspektiv på skjønnlitteraturen (An Ecophilosophical Perspective on Literature). M.A. thesis in the Department of the History of Ideas, University of Oslo. Examines some representative selections from literature, West and East, for their ecological view of the world, for example Ernest Hemingway's Old Man and the Sea, and some Japanese haiku. Andersen is now teaching at Nansenskolen in Lillehammer, Norway, a humanistic academy of higher education. (Norway)

Anderson, Christopher B., Gene E. Likens, Ricardo Rozzi, Julio R. Gutiérrez, Juan J. Armesto, and Alexandria Poole. "Integrating Science and Society through Long-Term Socio-Ecological Research." *Environmental Ethics* 30(2008):295-312. Long-term ecological research (LTER), addressing problems that encompass decadal or longer time frames, began as a formal term and program in the United States in 1980. While long-term ecological studies and observation began as early as the 1400s and 1800s in Asia and Europe, respectively, the long-term approach was not formalized until the establishment of the U.S. long-term ecological research programs. These programs permitted ecosystem-level experiments and cross-site comparisons that led to insights into the biosphere's structure and function. The holistic ecosystem approach of this initiative also allowed the incorporation of the human-dimension of ecology and recently has given rise to a new concept of long-term socio-ecological research (LTSER). Today, long-term ecological research programs exist in at least thirty-two countries (i.e., members of the International Long-Term Ecological Research Network, ILTER). However, consolidation of the

international network within the long-term socio-ecological research paradigm still requires: (1) inclusion of certain remote regions of the world, such as southwestern South America, that are still poorly represented; (2) modifications of the type of research conducted, such as integrating social and natural sciences with the humanities and ethics; and (3) the incorporation of findings and results into broader social and political processes. In this context, a nascent long-term socio-ecological research network in Chile, which extends over the longest latitudinal range of temperate forest in the Southern Hemisphere, adds a new remote region to international long-term ecological research previously overlooked. In addition, collaboration with the University of North Texas and other international partners helps to further develop an interdisciplinary approach for the integration of the ecological sciences and environmental philosophy together with traditional ecological knowledge, informal and formal education, policy, the humanities, socio-political processes, and biocultural conservation. (EE)

Frodeman, Robert. "Philosophy Unbound: *Environmental Ethics* at the End of the Earth." *Environmental Ethics* 30(2008):313-324. Environmental challenges such as those facing the Cape Horn region of Chile exceed the competency of any disciplinary framework. Interdisciplinary approaches to knowledge—combining the expertise of several disciplines as well as the trans-disciplinary perspectives of the public and private sectors—require a unifying element that helps integrate such disparate perspectives. The field of philosophy, which traditionally has offered a view of the whole of knowledge, can serve in this role again, if philosophers are willing to embrace a de-disciplined expression of philosophy. (EE)

Rozzi, Ricardo, Ximena Arango, Francisca Massardo, Christopher Anderson, Kurt Heidinger, and Kelli Moses. "Field Environmental Philosophy and Biocultural Conservation: The Omora Ethnobotanical Park Educational Program." *Environmental Ethics* 30(2008):325-336. Habitats (where we live), habits (how we live), and inhabitants (who we are) constitute an ecosystem unit. The biosphere is composed of a reticulate mosaic of these habitat-habit-inhabitant units, where humans (with their indigenous languages, ecological knowledge, and practices) have coevolved. Today, these diverse ecosystem units are being violently destroyed by the imposition of a single global colonial cultural model. In Cape Horn at the southern end of the Americas, educators, authorities, and decision makers do not know about the native habitats, language, and flora, and do not distinguish between Cape Horn's flora and the flora that grows in other parts of the country or the world. In contrast, indigenous people and old residents have a detailed knowledge, but they do not participate in education, and decision making. It is not *Homo sapiens* in general, but bioculturally biased educators, authorities, and decision makers who need to be transformed into (educated and responsible) members and citizen of biocultural communities. The Omora Ethnobotanical Park educational program was launched to contribute to a biocultural citizenship involving three critical steps: (1) the disclosing of biocultural diversity with a "fine filter" approach that permits understanding of the cultural and ecological diversity hidden by general universal labels; (2) direct "face-to-face" encounters with human and nonhuman co-inhabitants; and (3) actions for protection of habitats and implementation of interpretative spaces that facilitate direct encounters and conservation of biocultural diversity. These steps have been implemented at local and regional scales through the creation of the Omora Ethnobotanical Park and the UNESCO Cape Horn Biosphere Reserve. (EE)

Anderson, Dana. "Ethical Sight." *Environmental Ethics* 29(2007):113-130. Unconsidered visual acts carry with them embedded presuppositions that arise with the speed of thought. The mind's virtually instantaneous labeling of objects perceived forces subconscious (though learned) categorization that infects the results obtained from acts seeing acts. Chief among these biased results is a presumed divide between self and other that is both ecologically false and philosophically dangerous. (EE)

Anderson, J. W., "U. S. Has No Role in U. N. Treaty Process; Senate Reluctant to Ratify," Resources (Resources for the Future), Issue 148, Summer 2002, pp. 12-16. Thirteen global environmental treaties have gone into force in the last three decades, but the United States is party to only half of them. The Senate's great reluctance to ratify loosely worded treaties, such as the Kyoto Protocol, has meant the United States has no role in their implementation. One reason the Senate is reluctant to ratify is that the United States takes these treaties more seriously than do other nations. Elsewhere the treaties, vaguely worded, are loosely enforced. In the United States treaties become U.S. law, and the nature of the legal system, including lawsuits by environmentalists, would force the U.S. government to live up to its treaty commitments more rigorously than other countries might. Elsewhere, especially in developing countries, these treaties mostly gather dust on the desks of government officials. Thoughtful article. Anderson is a journalist in residence at Resources for the Future, Washington. (v.13,#4)

Anderson, James C. "Moral Planes and Intrinsic Values." Environmental Ethics 13(1991):49-58. In his book, Earth and Other Ethics, Christopher Stone attempts to account for the moral dimension of our lives insofar as it extends to nonhuman animals, plants, species, ecosystems, and even inanimate objects. In his effort to do this, he introduces a technical notion, the moral plane. Moral planes are defined both by the ontological commitments they make and by the governance rules (moral maxims) that pertain to the sorts of entities included in the plane. By introducing these planes, Stone is left with a set of problems. (1) Do the planes provide anything more objective than a set of alternative ways of looking at moral problems? (2) How can one resolve apparent conflicts between the recommendations forthcoming from distinct planes? (3) Why do certain entities constitute moral planes; and how do we decide which planes to "buy into?" Stone's answers to these questions endorse a series of concessions to moral relativism. In this paper I outline an alternative to Stone's moral planes which, while sympathetic to his ethical concerns, comes down squarely on the side of moral realism. Anderson is in the department of philosophy, University of Wisconsin-Madison, Madison, WI. (EE)

Anderson, James C., "Species Equality and the Foundations of Moral Theory." Environmental Values Vol.2 No.4(1993):347-366. ABSTRACT: The paper discusses various concepts of 'species equality' and 'species superiority' and the assumptions concerning intrinsic value on which they depend. I investigate what philosophers from the traditional deontological (Taylor and Lombardi) and utilitarian (Singer and Attfield) perspectives have meant by their claims for species equality. I attempt to provide a framework of intrinsic values that justifies one sense in which members of a species can be said to be superior to members of another species. KEYWORDS: Equality, superiority, intrinsic values. Department of Philosophy, University of Wisconsin-Madison, Madison, Wisconsin 53706, USA.

Anderson, Jay A., "A Conceptual Framework for Evaluating and Quantifying Naturalness," Conservation

Biology, vol. 5, no. 3, September 1991. "Naturalness is a scientific concept that can be evaluated and quantified. Intactness or integrity of ecosystems can be defined and assessed in similar ways. Three indices of naturalness are proposed: 1) the degree to which the system would change if humans were removed, 2) the amount of cultural energy required to maintain the functioning of the system as it currently exists, and 3) the complement of native species currently in an area compared to the suite of species in the area prior to settlement. These indices are complementary and provide a conceptual framework for evaluating naturalness. The latter two can be quantified. Anderson is in the Department of Biological Sciences, Idaho State University, Pocatello. Demonstrating why Americans should turn to private entrepreneurs rather than the federal government to guarantee the protection and improvement of environmental quality, the authors document numerous examples of how entrepreneurs have satisfied the growing demand for environmental quality. (v8,#2)

Anderson, Warwick, "A New Approach to Regulating the Use of Animals in Science", Bioethics 4(1990):45-54. There is now a growing acceptance amongst scientists world-wide that rational and effective guidelines are needed for experimental work involving animals. Ideally, these rules in each country should be based on a set of internationally accepted general principles but at the same time reflect local cultural, scientific and legal conditions. In Australia, the national Code of Practice for the scientific use of animals has just been revised. The development of the Australian Code has been driven largely by the research community itself, and partly because of this the Code has unique features. Amongst the most important features is the requirement that an animal experimentation ethics committee should approve experiments only if the worth of the experiment outweighs the adverse effects on the animals. The paper discusses animal experimental ethics committees and other features of the Code.

Andersson, Petra. *Humanity and Nature: Towards a Consistent Holistic Environmental Ethics*. Göteborg, Sweden: Acta Philosophica Gothoburgensia, no 20, 2007. Andersson completed and has now published this Ph.D. thesis in the Department of Philosophy, Göteborg University (Box 200, SE-405 30 Göteborg). Within the theoretical framework of holistic environmental ethics, moral status is ascribed to biotic wholes, such as ecosystems, species and landscapes. The purpose of holistic environmental ethics is not entirely clear, since the framework contains conflicting ideas about which properties of the biotic whole contribute to moral status, and to which moral reasons this moral status gives rise. The aim of this thesis is to investigate the prospects of an internally consistent version of holistic environmental ethics. On the basis of an initial analysis, the tensions are organized in three themeshuman-centered, integrity-centered, and nature-centered ethicsand are then analyzed with regard the claim that naturalness is an important contributor to the moral status of biotic wholes. If naturalness is seen as a binary property, it creates a grave incoherence. If naturalness is instead understood in more nuanced terms (so that naturalness can be

a question of different degrees or senses), some of these problems become less serious, but new problems emerge. In particular, the question whether a version of holistic environmental ethics that incorporates nature-centeredness may allow human beings a reasonable space remains. If nature-centeredness is rejected, however, several internal tensions within a holistic environmental ethics may be resolved. It is therefore argued that a plausible ethics should abandon the nature-centered theme, i.e., reject the idea of "natural nature" as being morally significant in itself. The idea that integrity gives rise to moral status of a biotic whole is more fruitful, and can also be combined with most of the particular opinions that might motivate nature-centeredness. Integrity-centeredness may also be consistently combined with human-centeredness, and a holistic environmental ethic may thus provide reasonable room for human beings in nature. Keywords include biotic communities, biotic wholes, denaturalization, ecocentrism, environmental ethics, holism, human membership in biotic communities, moral status, naturalness, nature, nature knows best, and the end of nature.

Andrews, John, "Weak Panpsychism and Environmental Ethics," Environmental Values 7(1998): 381-396. Weak panpsychism, the view that mindlike qualities are widespread in nature, has recently been argued for by the prominent ecofeminist Val Plumwood and has been used by her to ground an ethic of respect for nature. This ethic advocates a principle of respect for difference, the rejection of moral hierarchy and the inclusion of plants, mountains, rivers and ecosystems within the moral community. I argue that weak panpsychism cannot, convincingly, justify the rejection of moral hierarchy, as it is compatible with it. Also the intentional criterion of mind, employed by weak panpsychism, which includes teleology, has the counter-intuitive implication of giving machines moral status. I cast doubt on the claims that (i) intentionality is a necessary condition for moral status and that (ii) it is sufficient for the ascription of agency. It is suggested that any account of intentionality that allows it to be predicated of mountains, rivers etc. would be widely, and correctly regarded as a reductio of that account. Finally an

aesthetic reinterpretation of weak panpsychism is offered. KEYWORDS: weak panpsychism, assimilationism, dualism, intentionality, agency. John Andrews is at the University of Reading, UK. (EV)

Angier, Natalie, "In Mandrill Society, Life Is a Girl Thing," New York Times (5/23/00). Mandrills threatened by logging and commercial hunting. A type of monkey called Mandrills form huge societies sometimes numbering over 1000 individuals. These groupings are extremely cohesive and persistent and they consist almost exclusively of females and their young. Males, who are three times larger than females (three feet tall and weighing about 90 pounds versus 25 pounds for females), live alone and only interact with the group when the females are in estrus. The recent rise in the "bush meat trade" the hunting of wild animals in general and primates in particular -- is a threat to Mandrills because they travel long distances in huge numbers making them especially vulnerable to commercial hunters who use the expanding network of logging roads to penetrate once inaccessible forests. "Some conservation organizations now rank the bush meat trade as the single greatest threat to primates and other wildlife, outstripping in severity even the familiar ecovillain, habitat loss." Conservationists are trying to add "sensitivity to wildlife" to the criteria logging companies must meet to have their wood certified as sustainable, thus forcing timber companies to keep commercial hunters off their logging roads and away from threatened species. Home Depot, a chain of home-improvement stores, has announced it will buy sustainable wood "whenever possible." (v.11,#2)

Animal and their Legal Rights. 4th edition, 1990. Washington, DC: Animal Welfare Institute, 1990. Fifteen articles and an appendix with the principal laws affording animal welfare. (v3,#1)

Animal Conservation: A Journal of Ecology, Evolution, and Genetics, a new journal, calls for papers. The journal is published for the Zoological Society of London. There are several editors: in the U.K.: Dr. Michael W. Bruford, Institute of Zoology, Zoological Society of London, London NW1 4RY, UK., In the U.S.: Dr. John L. Gittleman, Department of Ecology and Evolutionary Biology, University of Tennessee, Knoxville, TN 37996. (v8,#2)

Animal Issues is a new journal aimed to investigate philosophical and ethical issues related to human/animal interactions. Papers are invited on any topics within this general area. Word length should be 4,000-10,000 words and papers should preferably be sent on a Mac disc by e-mail to the editor, or if this is not possible, a hard copy should be sent to the editor. The founding editor is Denise Russell, Department of General Philosophy, University of Sydney, N.S.W. 2006, Australia, e-mail: Denise.Russell@philosophy.su.edu.au. Co-editors: L. Birke, Institute for Women's Studies, University of Lancaster, United Kingdom; B. Forsman, Department of Medical Ethics, University of Lund, Sweden; P. Hallen, Institute of Science and Technology Policy, Murdoch University, Perth, Australia; F. Mathews, School of Philosophy, La Trobe University, Victoria, Australia; V. Plumwood, Department of Philosophy, Montana University, United States.

Vol. 1, No. 1, 1997, contained the following articles:

Freya Mathews, "Living with Animals"

Val Plumwood, "Babe: The Tale of the Speaking Meat," Part 1

Lynda Birke, "Science and Animals, or, Why Cyril Won't Win the Nobel Prize" Emma Munro, "Speciesism and Sexism"

plus an interview with Peter Singer.

Vol. 1, No. 2 1997, contained the following articles:

Andrew Brennan, "Ethics, Conflict and Animal Research"

Birgitta Forsman, "Two Different Approaches to Gene Technology in Animals" Val Plumwood, "Babe: The Tale of the Speaking Meat," Part II

Lynda Birke and Mike Michael, "Hybrids, Rights and Their Proliferation"

plus an interview with Julia Bell.

Subscriptions (1998-99 rates): Australia and New Zealand: A\$12 per issue (including postage). Other countries: A\$20 per issue (including postage). Send payment with your name and address to: Dr. Denise Russell, The Editor, Animal Issues, address above. (v9,#1)

Animal Issues has now published three volumes. Sample articles:

--Brennan, Andrew, "Ethics, Conflict, and Animal Research," vol. 1, No. 2, 1997.

--Mathews, Freya, "Living with Animals," vol. 1, no. 1, 1997.

--Quain, Anne, "Is There a Problem in Attributing Beliefs and Intentionality to Animals," vol. 2, no. 2, 1998.

Annals of Earth is a periodical published by the Center for the Protection and Restoration of Waters at Ocean Arks International and the Lindisfarne Association. Ocean Arks was incorporated in 1982 to disseminate the ideas and practice of ecological sustainability throughout the world. It has recently established a Center for the Protection and Restoration of Waters. Lindisfarne, founded in 1972, is an association of individuals and groups dedicated to fostering the emergence of a new global culture. Their objective is to "restore the land, protect the seas, and inform the Earth's stewards." Annals of Earth can be obtained for a contribution of \$ 15.00 annually. Address: One Locust Street, Falmouth, MA 02540. John Todd is president of Ocean Arks International and Nancy Jack Todd is vice-president and editor of Annals. (v1,#3)

Anoliefo, G.O., Isikhuemhen, O.S., and Ochije, N.R., "Environmental implications of the erosion of cultural taboo practices in Awka-South local government area of Anambra State, Migeria: 1. Forests, trees, and water resource preservation," Journal of Agricultural and Environmental Ethics 16(2003):281-296. Cultural taboos and their sanctions have helped to check abuse of the environment at least among the local people. The disregard for these traditional checks and balances especially among Christians has adversely affected their enforcement at this time. The "god" of the shrine in Obunagu village was much revered until the advent of Christianity. This religion has had an eroding effect on the taboos, which were put in place to protect their forests and streams. The abandonment of traditional cultural practices is doing harm that goes beyond the abrogation of traditional cultural practices to serious threat to natural environmental structures. KEY WORDS: cultural taboos, forest, shrines, sustainability, traditional practices, trees. (JAEE)

Anoliefo, G.O., O.S. Isikhuemhen and E.C. Okolo. "Traditional Coping Mechanism and Environmental Sustainability Strategies in Nnewi, Nigeria," Journal of Agricultural and Environmental Ethics 11(1999):101-109. Nnewi is situated some 30 kilometres South East of Onitsha in Anambra State in the southeastern part of Nigeria. This highly commercial town has undergone rapid urbanisation and industrialisation within the past two decades, since the end of the 1967-1970 Nigerian civil war. The Igbo community of the study area had traditionally employed bioconversion methods and other indigenous technology to process or recycle bio and non-degradable wastes. Industrialisation has enjoyed priority status in this locality as a requirement for modernisation and economic progress. The rapid urbanisation, aggressive industrialisation, and the attendant uncontrolled population growth have had a deleterious impact on the environment. There is now a wide range of industrial wastes that are released daily into the environment. Effects of these activities on the socio-cultural practices of the people, plant genetic resources and the environment are highlighted. In addition to palliative measures suggested here, a call is made to revisit the successful indigenous waste treatment and management technology formerly practised by the Igbo community. The importance of combining modern biotechnological approaches with the indigenous technology, norms and practices of Nnewi people to effect suitable waste treatment and management, as well as improving the living habits and the education of the people about their

environment, is recommended. (JAEE)

Ansink, Erik, Lars Hein and Knut Per Hasund, "To Value Functions or Services? An Analysis of Ecosystem Valuation Approaches," *Environmental Values* 17(2008):489-503. Monetary valuation of ecosystem services is a widely used approach to quantify the benefits supplied by the natural environment to society. An alternative approach is the monetary valuation of ecosystem functions, which is defined as the capacity of the ecosystem to supply services. Using two European case-study areas, this paper explores the relative advantages of the two valuation approaches. This is done using a conceptual analysis, a qualitative application, and an overall comparison of both approaches. It is concluded that both approaches can be defended on theoretical grounds, and - if properly applied - will provide the same value estimates. However, valuation of ecosystem services is preferred from a practical point of view. Because there is no one-to-one match between functions and services, researchers should be consistent in their valuation approach. To avoid overlooking or overlapping of values, valuation should either be solely based on functions, or solely based on services.

Anthony, Brian Patrick, "Nature's Cathedral: The Union of Theology and Ecology in the Writings of John Muir," Ecotheology 7 (1, July 2002):74-80. John Muir has strongly impacted the environmental movement since he penned his works during the nineteenth and early twentieth centuries. While the Scottish-born naturalist is well-known for his rugged individualism, the driving force behind his thought and effort was his connection with the Divine. Muir inherited a seeking soul from his devoutly Reformist father, Daniel. The younger Muir, however, would find his principal inspiration in the gospel of nature. A foray into industry convinced Muir that the stain of civilisation blinds us to this original scripture. Muir spoke of a distinct correlation between humanity's spiritual ills and the destruction of the natural world, and suggested an extension of the Christian ethic to all creatures. In his various travelogues, he offers an illuminating vision of the God of nature, and humanity's position in relation to both Creator and creation.

Anthony, Raymond, "Risk Communication, Value Judgments, and the Public-Policy Maker Relationship in a Climate of Public Sensitivity toward Animals: Revisiting Britain's Foot and Mouth Crisis," Journal of Agricultural and Environmental Ethics 17(2004):363-383. This paper offers some suggestions on, and encouragement for, how to be better at risk communication in times of agricultural crisis. During the foot and mouth epizootic, the British public, having no precedent to deal with such a rapid and widespread epizootic, no existing rules or conventions, and no social or political consensus, was forced to confront the facts of a perceived "economic disease." Foot and mouth appeared as an economic disease because the major push to eradicate it was motivated exclusively by trade and economic reasons and not because of

threats it posed to the lives of human beings and livestock. The British public deferred responsibility to their elected officials for a speedy end to this non-life threatening viral epizootic. The latter, however, did not have a contingency plan in place to tackle such an extensive outbreak. The appeal to an existing policy, i.e., mass eradication, as the exclusive strategy of containment was a difficult pill for the public to swallow well before the end of the 226-day ordeal.

Public moral uneasiness during the crisis, while perhaps symbolic of growing discontent with an already fractured relationship with farmed animals and the state of animal farming today, arguably, also reflected deep disappointment in government agents to recognize inherently and conditionally normative assumptions in their argument as well as recognize their narrow conception of risk. Furthermore, broader stakeholder participation was clearly missing from the outset, especially with respect to the issue of vaccination. A greater appreciation for two-way risk communication is suggested for science-based public policy in agriculture, followed by suggestions on how to be more vigilant in the future. Keywords: agricultural ethics, animal agriculture, foot and mouth disease, risk. The author is in the Department of Philosophy and Religious Studies, Iowa State University, Ames, Iowa. (JAEE)

Apffel-Marglin, Frederique, "From Fieldwork to Mutual Learning: Working with PRATEC," Environmental Values 11(2002):345-367. This paper places the work of a Peruvian NGO (PRATEC), with which the author collaborates, within a broad context of the theory of knowledge. The three members of PRATEC were engaged in different aspects of the development enterprise. Out of their perceived failure of that enterprise, they deprofessionalised themselves and founded this NGO. The author argues that within the professional academic disciplines it is impossible to produce a knowledge that can contribute to the procreative concerns of communities, that is, their concerns about their continuity and well-being. She does a brief historical review of the emergence of the modern university in the nineteenth century and the hidden political agenda of the new so called value-free knowledge it institutionalised. She ends up advocating a rejection of the double participation necessitated by professional academic disciplines. (EV)

Aplet, Greg, Nels Johnson, Jeffrey T. Olson, and V. Alaric Sample, eds., Defining Sustainable Forestry. Washington: Island Press, 1993. 320 pages. \$ 24.95 paper. \$ 49.95 hardcover. Aplet, Gregory H., "On the Nature of Wilderness: Exploring what Wilderness Really Protects," Denver

University Law Review 76(1999):347-367. Wilderness is neither simply an idea nor a place. It is a place where an idea is clearly expressed. ... In an effort to bridge the chasm that has developed between the critics and the defenders of wilderness, this Essay examines the qualities of a place that confer wildness and explores some of the implications of treating wildness as a quality best expressed in the places we call wilderness, but also infused in special places closer to home" (p. 349). "Wilderness is criticized for separating people from nature, for ignoring aboriginal people, and for holding nature static, even as it is revered as a place. The representation of wilderness described here as the end of two-dimensional continuum of wildness defined by naturalness and freedom from human control offers a way out of this dilemma. By describing wildness as a continuum, we acknowledge the wildness that is all around us even as we celebrate the places at the end of the continuum" (p. 366). Aplet is a forest ecologist with The Wilderness Society. (v.12,#4)

Appleby, Michael C., "Sustainable Agriculture is Humane, Humane Agriculture is Sustainable," Journal of Agricultural and Environmental Ethics 18(2005):293-303. Procedures that increase the sustainability of agriculture often result in animals being treated more humanely: both livestock in animal and mixed farming and wildlife in arable farming. Equally, procedures ensuring humane treatment of farm animals often increase sustainability, for example in disease control and manure management. This overlap between sustainability and humaneness is not coincidental. Both approaches can be said to be animal centered, to be based on the fact that animal production is primarily a biological process. Proponents of both will gain from recognition of commonality and development of cooperation. A collaborative approach to humane sustainable agriculture will benefit animals, people, and the environment. Keywords: agriculture - animal production - animal welfare - humaneness - livestock - sustainability. Appleby is with the Humane Society of the United States, Washington, DC. (JAEE)

Appleby, Michael C. et al (six others), "What price cheap food?" Journal of Agricultural and Environmental Ethics 16(2003):395-408. Report of a meeting that gathered many of UK senior animal scientists with representatives of the farming industry, consumer groups, animal welfare groups, and environmentalists. There was strong consensus that the current economic structure of agriculture cannot adequately address major issues of concern to society: farm incomes, food security and safety, the needs of developing countries, animal welfare, and the environment. These issues must be addressed by a combination of legislation, restructuring of the market, and use of public funds. KEY WORDS: agriculture, animal welfare, development, economics, environment, food, sustainability. (JAEE)

Appleton, Jay, "Nature as Honorary Art," Environmental Values 7(1998): 255-266. This paper addresses

the apparent difficulty experienced by philosophers in applying the methodology of art criticism to the aesthetics of nature and uses the idea of 'narrative' to explore it. A short poem is chosen which recounts the 'narrative' of a simple natural process - the passage of day into night - and this is followed by a simplified critique illustrating how the poem invites questions relating to style, technique, subject, etc., leading to the query whether the art form (poem) can be dispensed with and the subject (nature) be left to tell its own story, using the 'language' of symbolism. The interface between art and science is reviewed particularly in the light of the ideas of John Dewey and what has happened since. The 'symbolism of environmental opportunity' is proposed as the key to crossing the arts/science boundary, and the question is raised whether the distinctiveness of nature is of paramount importance in this context. Various grounds for scepticism are examined, e.g. the danger of drawing inferences about human interaction with nature from the behaviour of other species. KEYWORDS: Nature, art, aesthetics, symbolism, prospect/refuge theory. Jay Appleton is at Cottingham, East Yorkshire, UK. (EV)

Arai, A. Bruce "Science and Culture in the Environmental State: The Case of Reactor Layups at Ontario Hydro", Organization and Environment 14 (No. 4, December 2001) pp.409-24. The widespread concern about the declining state of our physical environment is often accompanied by frustration about what to do to prevent or even reverse such deterioration. In the past, policy makers, legislators, and the general public have usually turned to scientists and scientific knowledge for answers. But recently, theorists and others have re-emphasized the importance of culture in understanding the environment. In this article, this culturalist critique of scientific knowledge is discussed and is then related to the decision by Ontario Hydro to lay up seven of its nuclear reactors. This situation is used to illustrate the continuing relevance of scientific knowledge for addressing environmental concerns. Arai is associate professor in the Department of Sociology and Anthropology at Wilfred Laurier University, Waterloo, Ontario. (v.13,#2)

Arbor, J.L., "Animal Chauvinism, Plant-Regarding Ethics and the Torture of Trees", Australasian Journal of Philosophy, 64, (1986): 335-39. The extension of moral considerability to "higher" animals on the basis of properties possessed by both animals and humans excludes many species of animals and non-animate beings. The author claims that the exclusion of "lower" animals from the class marked out for privileged treatment by Western ethics together with the assumption that living inanimate beings can safely be excluded deserves to be queried. It is not suggested that the value of human and animal states of consciousness be denied, however, a plant-regarding ethic would reject the claim that in all cases of conflict between the interests of animals and plants the former always prevails. According to the author "[a] plant-regarding ethic requires the rooting out of all ... forms of animal chauvinism and a branching forth of new sentiments and new systems of thought."

Argow, Keith A. "This Land Is Their Land: The Potential and Diversity of Nonindustrial Private Forests."

Ariansen, Per, "Anthropocentrism with a Human Face" draft article, in English. Ariansen proposes an anthropocentric environmental ethic that gives due room for the moral intuitions that it is blameworthy to mistreat animals and even, in some cases, to destroy inanimate objects, though direct moral obligations are toward humans and human projects only. Ariansen holds that we could not act morally directly toward plants or animals, even if we very strongly wanted to. Still, a deep respect for the suffering of others imposes upon humans a limited prime facie commitment also to animal welfare, and even to the wanton destruction of the environment. Copies on request from the author: Filosofisk institutt, P. A. Munchs hus, Postboks 1020, Blindern, 0315 Oslo, Norway. (v5,#2) (Finland)

Ariansen, Per, "Anthropocentrism with a Human Face," Opuscula (published by the Examen Philosophicum Section of the Department of Philosophy, University of Oslo), Fall 1994. In English. Ariansen argues for an anthropocentric environmental ethic that finds it morally blameworthy to mistreat animals, although direct moral obligations are towards humans. We could not act morally directly towards plants or animals even if we very strongly wanted to. Sentient animals are, as far as we know, in a position where they are unable to see wilfully inflicted pain as different from any other occurrence of pain. It is therefore simply impossible to offer ethics to animals. They will not be able to understand what they are being offered. It is impossible to morally offend an animal, though clearly it is possible to inflict pain on them and in manners that morally offend humans.

Duties toward animals are in reality duties towards ourselves, though the way this is so is often misunderstood. We ought to have respect for the pain of others even if it is clear that the patient will never discover that the pain or loss inflicted had a human origin. The morally relevant relationship between humans and non-humans is essentially dependent upon the scheme of morality as it unfolds in inter-human society. Although this scheme centers around the autonomy of the moral agent, it nevertheless presupposes a respect for the suffering of others, since in a world without suffering, lying and cheating would have no moral significance. A deep respect for the suffering of others imposes on humans a limited prima facie commitment also to animal welfare. Some case can also be made that the destruction of non-sentient and non-animate nature, such as a crystal, can be analogously treated. Ariansen teaches philosophy at the University of Oslo and is the author of Miljøfilosofi: En Innføring (Environmental Philosophy: An Introduction).

Ariansen also has two forthcoming papers: (1) "Sustainability, Morality and Future Generations," given at a conference in Kyoto, Japan, sponsored by the Future Generation Alliance Foundation and the Kyoto Forum. (2) "Beyond Parfit's Paradox," prepared for the October 1994 conference, "Our Responsibilities toward Future Generations," held in Malta. The first general text in environmental ethics in Norwegian. Per Ariansen is on the philosophy faculty at Oslo in the examen philosophicum program. Address: Department of Philosophy, University of Oslo, Boks 1020, 0315 Oslo 3. Phone 47 22 855938. Fax 857551. E-mail: per.ariensen@filosofi.uio.no. From the analytical table of contents: Chapter 1. Introduction. A philosophical searchlight on environmental problemstotics of the book. Attitudes, choices of action, and the concept of nature. Chapter 2. Attitudes toward Nature: A Historical Sketch. The intellectual tradition as a source of renewed attitudes to nature. The idea of the conquest of nature in biblical texts. Where is the root of the crisis? Other hypotheses about the origin of an attitude of conquest toward nature. The technological optimism of our times. The development of ecology. Chapter 3. Environmental Problems: Topics for Science and Philosophy. Analyzing environmental problems. What does it mean that something is a problem.

Chapter 4. Analyzing lines of action: a decision theoretical approach. Decision theory and analysis of action. Models for the dynamics of complex systems: an example. Complex situations of

cooperation: the game-theoretical situation. Chapter 5. What Is It That Has Value? Description and evaluation. Science and valuelessness. Concepts of value. Chapter 6. Ethical Theories. Consequentialist ethics. Non-consequentialist ethics. Moral disagreement. Chapter 7. Anthropocentric Environmental Ethics. The various schools of environmental ethics. Anthropocentric consequentialism: ideal types of attitudes and perspectives. Anthropocentric deontological ethics, rights and duties for humans only. Unspoiled nature as a transcendental condition for morality.

Chapter 8. Non-anthropocentric Environmental Ethics. Animal rights and animal welfare. Rights based on subjective interests. Rights stemming from objective interests (biocentrism). Rights for non-living objects and superindividual entities. Deep ecology. Chapter 9. Future Generations as Morally Concerned Parties. The welfare of future generations. Rights for future generations. Chapter 10. Responsibility and the Placing of Responsibility. Refining concepts of responsibility. Are there degrees of responsibility? To place responsibility. Epilogue: A Common future. References and a detailed table of contents. This book has been used at the University of Oslo, at the University of Trondheim, at the Telemark Distrikthogskole, at Bo (a district college), and at the Landbunkshogskolen pa As, at As (the Agricultural University). This book has also been translated into Swedish. Per Ariansen, Miljöfilosofi: En Introduktion. Nora: Bokförlaget Nya Doxa, 1993. ISBN 91-88248-33-X. Translated by Per Lennart Mansson. (Norway)

Ariansen, Per, "Heggelianismen i norsk miljødebatt," Tidsskrift for Alternativ Framtid (The Norwegian Journal for an Alternative Future), no. 3, 1994. An analysis of Hjalmar Hegge's environmental philosophy. Hegge is a Norwegian influential for two decades in the public debate on environmental issues, drawing on Rudolf Steiner and Johann V. von Goethe, and offering a critique of industrial society. (v5,#4)

Ariansen, Per and Jon Wetlesen, "Miljöfilosofi (Environmental Philosophy)," in K. E. Johansen, ed., Allmen inforing i etikk (Oslo: Cappelen, 1994). The authors are in philosophy at the University of Oslo. (Finland)

Ariansen, Per. "Platforms, Nature and Obligational Values" in Nina Witoszek and Harold Glasser, eds., Philosophical Dialogues: Arne Naess and the Progress of Ecophilosophy, Berkeley: University of California Press, forthcoming. An interpretation of the function of the deep ecology platform with an attempt to explain why the "doctrines" of deep ecology appear evasive. In the discussion about the concept of intrinsic value, a sketch of Ariansen's own brand of anthropocentrism is presented. (v7,#4)

Ariansen, Per. "The Non-utility Value of Nature. A contribution to understanding the value of biological diversity." Research paper by grant from The Norwegian Research Council. Norwegian Forestry Institute, 1995. Published in August 1996 as Working Paper No. 99, Centre for Technology and Culture, Oslo, 1996. In addition to all possible instrumental value, biological diversity also holds a constitutional value, in that it marks the constitutional framework for forming human identity, a framework which is prima facie protected against human destruction. (v7,#4)

Ariansen, Per. "Sustainability, Morality and Future Generations." Future Generations Journal, No. 17 (1995/3) Valletta, Malta. A revision in Norwegian is Ariansen, Per, "Barekraftighet, moral og fremtidige generasjoner." Printed in W. Lafferty & O. Langhelle (red.), Berekraftig utvikling. Oslo: AdNotam, Gyldendal, 1995. An English translation of the revision will appear in 1997. In addition to bringing forward some aspects of Ariansen's brand of anthropocentrism, the article also addresses briefly the "Parfit paradox", suggesting that the hypothetical question posed to future generations, whether they would rather exchange their plight for never having been born, rests on the mistaken understanding that this question is analogous to other questions about the preference of one state over another. The question breaks an "existential syntax". The state of never having been born cannot be evaluated by those who actually were born. Ariansen is in philosophy at the University of Oslo. (v7,#4)

Ariansen, Per. "Spirituality in a Secular World." In Masahiku Yazaki, ed. Beyond Egoism. Kyoto: Future Generations Alliance, 1996. A discussion about the possibility of giving meaning to a concept of spirituality. (v7,#4)

Arias-Maldonado, Manuel, "An Imaginary Solution? The Green Defence of Deliberative Democracy," *Environmental Values* 16(2007): 233-252. As part of the recent rethinking of green politics, the construction of a green democracy has been subjected to increasing scrutiny. There is a growing consensus around deliberative democracy as the preferred model for the realisation of the green programme. As a result several arguments emerge when deliberative principles and procedures are to be justified from a green standpoint. This paper offers a critical assessment of the green case for deliberative democracy, showing that deliberation is being asked to deliver more than it is able to. However, it is suggested that the connection between sustainability, understood as a normative principle, and deliberative procedures may ultimately offer the best grounds for such a defence. Arias-Maldonado is in political science, University of Malaga, Malaga, Spain.

Arler, Finn, "Aspects Of Landscape Or Nature Quality," Landscape Ecology 15 (No. 3, Apr 01 2000): 291- . (v.11,#2)

Arler, Finn, "Justice in the Air: Energy Policy, Greenhouse Effect, and the Question of Global Justice," Human Ecology Review 2 (no. 1, winter/spring 1995):40- . The central ethical issues in reacting to the problem of an increasing greenhouse effect. Energy policy, dilemmas of justice, impartiality versus mutual advantage, ideal versus conditional justice, monological (ideal observer) versus procedural (participant parties) justice, membership and the concentric circle theory (increased obligations toward those nearest us), global partnership, criteria of justice (need, desert, entitlement, luck, means, abilities), principles versus judgment. The principles of equality, precaution, prevention, cost-effectiveness, responsibility, care, solidarity, self-determination, sovereignty, justice between generations. Cost-benefit analyses, the relevance of previous actions, justice across borders. Arler is with the Man and Nature, Humanities Research Center, Odense University, and was until recently in philosophy and human ecology, Aarhus University, Denmark. (v6,#4)

Arler, Finn, "Aspects of Landscape or Nature Quality," Landscape Ecology 15(2000):291-302. Landscape or nature quality has become a key concept in relation to nature policy and landscape planning. In the first part of the article it is argued that these qualities should not be conceived as mere expressions of private or subjective preferences. Even though there may not be any "objective" or "scientific" method dealing with them, they are still values which can be shared, reflected on, and discussed in a reasonable way. The connoisseurs are introduced as experienced persons, who are particularly capable of identifying different kinds of qualities, bridge builders between cognition and evaluation. The second part of the article deals with four central sets of landscape or nature qualities: qualities related to species diversity, qualities related to "the atmospheres" and characters of places, pictorial qualities, and qualities related to narrativity. It is argued that experience of these and similar

qualities are an important part of human flourishing, and that they should therefore all have a prominent place in landscape planning. Arler is in philosophy, Aarhus University, Denmark.

Arler, Finn, "Energy Policy, Greenhouse-effect and Global Justice." Surveys the position of Denmark on CO₂ emissions, compares this with that of the United States and other countries, considers the rights of developing countries to energy use, recalls statements from the UNCED Rio de Janeiro conference, and asks what principles of justice might be used to set policy for energy in view of the greenhouse effect. Copies from Finn Arler, Department of Philosophy, University of Aarhus, Ndr. Ringgade Buildn. 327, DK-8000, Aarhus C, Denmark. (v5,#2)

Arler, Finn. "Global Partnership, Climate Change and Complex Equality," Environmental Values:Environmental Values 10(2001):301-330. The prospect of climate change due to human activities has put the question of inter- and intragenerational justice or equity in matters of common concern on the global agenda. This article will focus on the question of intragenerational justice in relation to these issues. This involves three basic questions. Firstly, the question of which distributive criteria may be relevant in the distribution of the goods and bads related to the increasing greenhouse effect. A series of criteria are discussed in relation to different understandings of the problem. The second question is which kind of relationship the global partnership is or should be considered to be in issues of common concern. It is argued that various understandings of the global partnership can be expected to result in the use of different criteria. This diversity leads us to the third question concerning the possibility of identifying an overall social ideal which can be used in cases where several different criteria may be useful. I shall

discuss one such ideal in particular, namely the ideal of complex equality. In the concluding remarks it is argued that a distribution of emission quotas to countries in accordance with population size is a reasonable starting point for an equitable solution, although it involves various problems of application. Keywords: Climate change, greenhouse effect, equity, justice, global partnership, common concerns, distributive criteria, social ideals, complex equality. Finn Arler is at the Department of Development and Planning, Division of Technology, Environment and Society, Aalborg University, Aalborg O, Denmark. (EV)

Armstrong-Buck, Susan. "Whitehead's Metaphysical System as a Foundation for Environmental Ethics." Environmental Ethics 8(1986):241-59. Environmental ethics would greatly benefit from an adequate metaphysical foundation. In an attempt to demonstrate the value of Whitehead's metaphysical system as such a foundation, I first discuss five central tenets of his thought. I then compare aspects of his philosophy with Peter Singer's utilitarianism, Tom Regan's rights theory, Aldo Leopold's land ethic, and Spinoza's system in order to indicate how a Whiteheadian approach can solve the difficulties of the other views as currently developed, and provide the basis for an environmental ethics which values individual entities in themselves and in their connectedness in a purposive natural order. Armstrong-Buck is in the

department of philosophy, Humboldt State University, Arcata, CA. (EE)

Armstrong, Susan, and Botzler, Richard, eds., Animal Ethics Reader. New York: Routledge, 2003. Over fifty selections. Theories of animal ethics. Animal capacities: pain, emotion, consciousness. Primates and cetaceans. Animals for food. Animal experimentation. Animals and biotechnology. Ethics and wildlife. Zoos, aquaria, and animals in entertainment. Animal companions. Animal law/animal activism. Armstrong is in philosophy, Botzler in wildlife at Humboldt State University, California. (v 14, #3)

Armstrong, Susan J. and Botzler, Richard G. (eds.), Environmental Ethics: Divergence and Convergence, Third Edition. (New York: McGraw-Hill, 2003). This anthology is designed to help students develop their own environmental ethic, based on a sympathetic but critical look at all of the major contemporary approaches, including ecofeminism and multicultural perspectives. The anthology encourages students to incorporate moral, aesthetic, scientific, historical, political and economic perspectives in developing their environmental ethic. This third edition is 60% new, with expanded attention to application of theories, including biotechnology, and includes case studies.

Armstrong, Susan J., and Botzler, Richard G., eds., Environmental Ethics: Divergence and Convergence. Third ed. Boston: McGraw Hill, 2003. Third edition of one of the most popular texts in environmental ethics. Over sixty percent of the readings are new, including land rights, biodiversity, environmental justice, and genetic engineering. Multidisciplinary. Includes non-Western perspectives. Ecofeminist perspectives. Cutting-edge articles in environmental theory. Includes a structure and standardized terminology for this developing field. Instructional aids for each chapter. Armstrong is in philosophy, Botzler in biology at Humboldt State University, California. (v.14, #4)

Armstrong-Buck, Susan, "What Process Philosophy Can Contribute to the Land Ethic and Deep Ecology," Trumpeter 8(1991):29-34. An analysis of intrinsic and inherent value, with attention to Callicott, Rolston, Regan, and others, also analysis of the sense of self-identification in deep ecology in Naess, Fox, Fox, and others. Armstrong-Buck claims that process metaphysics can complement these attempts at forming an environmental ethic, although process metaphysics is not without its own difficulties. Armstrong-Buck is professor of philosophy at Humboldt State University, Arcata, CA. (v2,#1)

Armstrong-Buck, Susan, "Whitehead's Metaphysical System as a Foundation for Environmental Ethics," Environmental Ethics 8(1986):241-259. Intuitions about the intrinsic value of nature require a metaphysical basis, and here it is argued that Whitehead's metaphysic provides that basis. Without this metaphysical grounding of value, Leopold's land ethic commits the Naturalistic Fallacy (p. 258). (Katz, Bibl # 1)

Arnason, Thorvardur, "Eigingildi í náttúrunni -- heimspeki á villigötum?" (in Icelandic). Interview by Thorvardur Arnason with Holmes Rolston, III, in Hugur 17(2005), pages 12-26. Published in 2006. Hugur is an annual, the only Icelandic periodical that is solely dedicated to philosophy. Intrinsic values in nature, multi-leveled values in nature, humans in nature, uniqueness of humans, anthropogenic and anthropocentric values in nature, duties to species, ecosystems. Iceland as an especially challenging landscape for environmental ethics, far north, on the mid-Atlantic ridge, a harsh environment, life in extreme environments, unusual aesthetic beauty.

Arnhart, Larry, Natural Right: The Biological Ethics of Human Nature. Albany, NY: State University of New York Press, 1998. 331 pages. How Darwinian biology supports an Aristotelian view of ethics as rooted in human nature. Defending a conception of "Darwinian natural right" based on the claim that the good is desirable, Arnhart argues that there are at least twenty natural desires that are universal to all human societies because they are based in human biology. The satisfaction of these natural desires constitutes a universal standard for judging social practice as either fulfilling or frustrating human nature, although prudence is required in judging what is best for particular circumstances. The familial bonding of parents and children and the conjugal bonding of men and women illustrates social behavior that conforms to Darwinian natural right. Slavery and psychopathy illustrate social behavior that contradict Darwinian natural right. The natural moral sense does not require religious belief, although such belief can sometimes reinforce the dictates of nature. Arnhart is in political science at Northern Illinois University. (v.9,#3)

Arnold, Craig Anthony, "The Reconstitution of Property: Property as a Web of Interests," The Harvard Environmental Law Review 26(no. 2, 2002):281-364. Theoretical critiques of the bundle of rights metaphor (e.g. its alienating effects, its preoccupation with the margins of property law, its abstraction, and its excessive rights focus). How courts persist in defining property rights according to the nature of the object of those rights. Three different theoretical perspectives that emphasize the importance of the object and person-object relationships in understanding property: environmental theories, personhood theories, and expectations theories. A web of interests is a superior metaphor, because the web of interests represents not only a set of interconnected relationships among persons who share interests (more than rights) in an object, whether tangible or intangible, but also a set of particular relationships persons have with objects that have particular characteristics relevant to property law. Ways in which the web of interests metaphor helps us see certain property issues differently than the bundle of rights metaphor--regulatory takings, ownership of ecologically valuable resources like land, water, and wildlife, and property issues in corporations or intellectual property. Arnold is in law, Chapman University, Orange, CA. (v.13, #3)

Arnold, Craig Anthony (Tony), "The Reconstitution of Property: Property as a Web of Interests," Harvard Environmental Law Review 26(no. 2, 2002):281-364. In an odd and surprising irony, a robust, comprehensive concept of private property is necessary to advance environmental values, and conversely, a decline in the importance and meaning of property hurts environmental values. A person claiming a property interest or property right should be expected to show how he or she is connected to the object of the property interest. Reconceiving every area of property law from a web-of-interest perspective deserves attention. For example, a landowner may not have a reasonable expectation of making an economically productive use of fragile coastal wetlands. Landowners' experiences with implementation of the Endangered Species Act by the U.S. Fish and Wildlife Service have resulted in significant landowner frustration. In the past, the bundle of rights metaphor served to free property law from both antiquated doctrines and a narrow concept of property as absolute control over physical things. In this Article, I have not only criticized the bundle of rights concept of property but also argued that property law is alive but in search of a reconstituting metaphor. Arnold is Professor of Law and Director of the Center for Land Resources, Chapman University School of Law, Orange, CA.

Arnold, Craig Anthony (Tony). "The Structure of Land Use Regulatory System in the United States." *Journal of Land Use and Environmental Law*, Vol. 22, no. 4 (2007): 441-523. This paper systematically analyzes the functions, location and scale, components, processes, values of the land use regulatory system in the United States. Arnold contends that critiques of the system as inherently inefficient, inequitable, or environmentally harmful are misplaced, and instead the system is able to mediate between people and places in a dynamic, functional, and adaptive manner. The system is relatively thin on law but thick on policy, tools, authority, and discretion. The article can be downloaded for free from the Social Science Research Network at: <http://papers.ssrn.com/sol3/papers.cfm?abstract_id=1020305>.

Arnold, Craig Anthony (Tony). *Fair and Healthy Land Use: Environmental Justice and Planning*. Chicago: APA Planning Advisory Service, 2007. Arnold offers a systematic evaluation of the relationships between environmental justice and land use planning. After summarizing the rise of the environmental justice movement, Arnold discusses the promise and failure of land use planning to achieve fair and healthy land use and environmental conditions in low-income and minority communities, including empirical evidence of zoning and land use disparities. He then lays out principles and tools of land use planning and regulation to achieve environmentally just communities: environmental justice

planning principles, the relationship between environmental justice and smart growth, regulatory tools (e.g., zoning, discretionary permits, impact fees), community participation principles and methods (emphasizing robust and meaningful deliberative participatory processes), environmental impact assessments, inherent limits on land use planning and regulation (e.g., private property rights, state preemption, and politics), and community infrastructure, housing, redevelopment, and brownfields.

Arnold, Craig Anthony, "Working Out an Environmental Ethic: Anniversary Lessons from Mono Lake," Wyoming Law Review 4(no. 1, 2004):1-55. Does environmental law reflect or encourage an environmental ethic? The Mono Lake (California) conflict, now twenty-five years old, offers an ideal case study of the role of environmental law and litigation in achieving environmental conservation and implementing an environmental ethic. The California Supreme Court's Mono Lake opinion is regarded as one of the ten most important environmental law cases of the twentieth century. It has been cited in over 100 judicial or administrative opinions. Environmental law matters but only as a component of a broader social and natural whole. Anthony is in law, Chapman University School of Law, Orange, CA. (v. 15, # 3)

Arrow, Kenneth, et al., "Economic Growth, Carrying Capacity, and the Environment," Science 268 (April 28, 1995): 520-521. Eleven authors, reporting from a Swedish conference; other authors include Robert Costanza, C. S. Holling, and David Pimentel. Economic policy typically ignores environmental concerns, or considers them tangential. But economic liberalization and other policies that promote gross national product are not substitutes for environmental policy. It is typically thought that in developing nations, environmental quality first degenerates and, with further development, later improves, a U-shaped curve. This is true for selected pollutants but not true for environmental quality as a whole. Economic policy needs to recognize carrying capacity and ecosystem resilience, though these are complex and dynamic, not simple and fixed relations. Economic liberation may require more, not less regulation, because the signals of ecosystem stress are frequently received after irreversible changes have already occurred, or are misinterpreted, or relocated to other nations, and there is little incentive under present policy for a more ecologically sustainable economics. Arrow is in economics at Stanford University; Costanza in ecological economics at the University of Maryland; Holling in zoology at the University of Florida; Pimentel in entomology, ecology, and systematics at Cornell University. Ashlin, Alison and Richard J. Ladle, "Environmental Science Adrift in the Blogosphere," Science 312 (14 April 2006): 201. There are now more than 11.7 million weblogs, and the number is doubling every five months. There are 400,000 featuring discussions on environmental and conservation-related issues. Some are highly credible, many are not; weblogs are here to stay. Generally the public rates them as more reliable than they are. Consider extinction rates. There is some scientific consensus that the rate is in the range of 74-150 species going extinct every day. A survey of 20 blogs produced a range of one to several thousand per day, with nearly half the sites claiming over 200 per day. The authors argue that environmental scientists need to become more effective and credible bloggers. Ashlin and Ladle are at the Oxford University Centre for the Environment.

Atran Scott, and Douglas Medin. *The Native Mind and the Cultural Construction of Nature*. Cambridge, MA: The MIT Press, 2008. Growing concern with protecting the environment is accompanied by diminishing human contact with nature, with adverse effects on conservation. Atran and Medin examine the cognitive consequences of this loss of knowledge, the relationship between how people think about nature and how they act upon it, and how thinking and acting are affected by cultural differences. They argue that despite a base of universal processes, cultural differences in how nature is understood are associated with significant differences in environmental decision-making and intergroup conflict. There is extensive discussion of two case studies: (1) agro-forestry among Maya Indians and Spanish speakers in Mexico and Guatemala, and (2) resource conflict between American Indians and Euro-American fishers in Wisconsin.

Attfield, Robin and Katharine Dell, eds., Values, Conflict and the Environment, published by the Ian Ramsey Centre, Oxford, and the Centre for Applied Ethics, Cardiff. 110 pages. 1989. This report of the Environmental Ethics Working Party, Ian Ramsey Center, St. Cross College, Oxford is a timely and stimulating contribution to current discussions about the future of the environment and human interaction with it. In the main report (Part One) a method of comprehensive weighting is introduced, defended, and then applied to public procedures and social practice. In Part Two, there is a criticism of comprehensive weighting and a response. Part Three contains four essays that depict value systems that form the broader sources of values in environmental issues: the Judeo-Christian tradition, and the traditions of secular humanism, Marxism, and environmentalism. First published by Westminster College, Oxford in 1989, and re-issued by Ashgate Publishing Co., in 1996. (v1,#4)

Attfield, Robin and Wilkins, Barry, "Sustainability". Environmental Values 3(1994):155-158. This paper supplies a critique of the view that a practice which ought not to be followed is ipso facto not sustainable, a view recently defended by Nigel Dower. It is argued that there are ethical criteria independent of the criterion of sustainability. The concept of sustainability is thus retrieved for the distinctive role and the important service in which environmental and social theorist (paradoxically including Dower) have hitherto employed it, not least when debating the nature, merits and demerits of sustainable of development. KEYWORDS:Sustainability, arguments, development, beneficiality, justice. Attfield and Wilkins are in the philosophy section at the University of Wales College of Cardiff, U.K. (EV)

Attfield, Robin, "Sylvan, Fox and Deep Ecology: A View from the Continental Shelf." Environmental Values Vol.2 No.1(1993):21-32. ABSTRACT: Both Richard Sylvan's trenchant critique of Deep Ecology and Warwick Fox's illuminating reinterpretation and defence are presented and appraised. Besides throwing light on the nature and the prospects of the defence of Deep Ecology and of its diverse axiological, epistemological and metaphysical strands, the appraisal discloses the range of normative positions open to those who reject anthropocentrism, of which Deep Ecology is no more than one (and, if Fox's account of its nature is right, may not be one at all). A position intermediate between Deep Ecology and anthropocentrism is advocated, which has been called by Wayne Sumner "middle-depth environmentalism--a kind of continental shelf between the shallow and deep extremes." KEYWORDS: Deep Ecology, impartiality, value-theory, identification, self-realization, biocentrism. School of English Studies, Journalism and Philosophy University of Wales College of Cardiff, PO Box 94, Cardiff CF1 3XB, UK.

Attfield, Robin, "Biocentrism, Moral Standing and Moral Significance." Philosophica 39 (1987): 47-58. A defence of the moral standing of all living entities, based on the analogical argument that all living entities have the capacity to realize a good of their own; a rejection of Taylor's biocentric egalitarianism. (Katz, Bibl # 2)

Attfield, Robin and Barry Wilkins, eds., International Justice and the Third World: Essays in the Philosophy of Development. London: Routledge, 1992. This anthology contests the view that there is no such thing as justice between societies of unequal power, and that there is no obligation to assist poor people in distant countries. Third World indebtedness is profoundly exploitative, and Third World debts should be unconditionally cancelled. This collection includes Robin Attfield, "Development and Environmentalism"; Geoff Hunt, "Is There a Conflict between Environmental Protection and the Development of the Third World?"; Nigel Dower, "Is There a Right to Sustainable Development?"; Barry Wilkins, "Debt and Underdevelopment: The Case for Cancelling Third World Debts." Other contributors are Kai Nelsen and Onora O'Neill. Both editors are at the University College of Wales, Cardiff. (v3,#3)

Attfield, Robin, "Biocentric Consequentialism, Pluralism and 'The Minimax Implication': A Reply to Alan Carter," Utilitas 15 (no. 1, March 2003): Alan Carter's recent review in Mind of my Ethics of the Global Environment combines praise of biocentric consequentialism (as presented there and in Value, Obligation and Meta-Ethics) with criticisms that it could advocate both minimal satisfaction of human needs and the extinction of 'inessential species' for the sake of generating extra people. Carter also maintains that as a monistic theory it is predictably inadequate to cover the full range of ethical issues, since only a pluralistic theory has this capacity. In this reply, I explain how the counterintuitive implications of biocentric consequentialism suggested by Carter (for population, needs-satisfaction and biodiversity preservation) are not implications, and argue that since pluralistic theories (in Carter's sense) either generate contradictions or collapse into monistic theories, the superiority of pluralistic theories is

far from predictable. Thus Carter's criticisms fail to undermine biocentric consequentialism as a normative theory applicable to the generality of ethical issues." Attfield is in philosophy at University of Wales, Cardiff.

Attfield, Robin, "The Precautionary Principle and Moral Values." Pages 152-164 in O'Riordan, Tim, and Cameron, James, eds., Interpreting the Precautionary Principle. London: Cameron and May, 1994.

Attfield, Robin, The Ethics of Environmental Concern. New York: Columbia University Press, 1983. Pp. xi, 220. Second edition: Athens, GA: University of Georgia Press, 1993. Hardback and paper. First edition: This is a major work of scholarship and argument that attempts, perhaps, to cover too much ground. Attfield has patterned his book after Passmore's Man's Responsibility for Nature (1974), the first important philosophical work in environmental ethics. Like Passmore, Attfield first canvasses the

religious and philosophical traditions of Western culture to show that "Stewardship" of nature does not imply "Domination"; thus, no new ethic of environmental concern is needed. This journey into the history of ideas is then followed by an argument designed to show that one old ethical theory, classical utilitarianism, is more than adequate to justify moral treatment of the environment. But Attfield's utilitarianism is nonanthropocentric: the intrinsic value to be maximized is not happiness or rational experience but the satisfaction of interests. Whatever has interests is valuable, and for Attfield, all living individuals have interests.

He thus arrives at a position that is "not as deep as 'deep ecology'" and yet deeper than the "shallow" kind of human-interest environmentalism. But the sticking point for any classical or total-view utilitarianism is the weighting of the values to be maximized. Attfield adopts Donald VanDeVeer's "Two Factor Egalitarianism" ["Interspecific Justice," *Inquiry* 22 (1979):55-79], the balancing of basic, serious, and peripheral interests in beings that lack or have self-consciousness. This view needs a very precise casuistry if it is to be at all successful, but I think it will always lead to a hopeless muddle: we are back with Mill's contrast of the dissatisfied Socrates and the satisfied pig. Is the gourmet's interest in milk-fed veal a basic interest or a peripheral one? Attfield is ultimately unable to overcome an anthropocentric bias, because of his rejection of environmental holism. Chapters on obligations to the future and the existence of possible people also reveal the unintelligibility of utilitarian thinking. Contains an extensive and valuable bibliography. (Katz, Bibl # 1) Attfield, Robin. The Ethics of Environmental Concern. Reviewed in Environmental Ethics 8(1986):77-82.

The second edition is updated with a new introduction and a detailed review of recent literature. (v3,#1)

Attfield, Robin, Value, Obligation, and Meta-Ethics. Amsterdam/Atlanta: Editions Rodopi B.V., 1995. 319 pages. \$ 31.00 paper. Part I, on Value, defends a biocentric theory of moral standing and the coherence and objectivity of belief in intrinsic value, despite recent objections. Chapter 3 is "What is Intrinsic Value?"; Chapter 4 begins with "The Intrinsic Value of Flourishing"; Chapter 6 is "Priorities Among Values." Intrinsic value is located in the flourishing of living creatures; specifically, a neo-Aristotelian, species-relative account is developed of wellbeing or flourishing, in terms of the essential capacities of species. There follows a theory of priorities, or of relative intrinsic value, in which the satisfaction of basic needs takes priority over other needs and wants, and the interests of complex and sophisticated creatures over those of others, where they are at stake. Parts two and three continue with theories of rightness and obligation and meta-ethics, defending a naturalist meta-ethic. This analysis continues Attfield's earlier work, A Theory of Value and Obligation (1987). Attfield teaches philosophy at the University of Cardiff, Wales. (v7,#1)

Attfield, Robin, Environmental Ethics: An Overview for the Twenty-First Century. Cambridge: Polity Press (Blackwell), 2003. Includes: Local and global environmental problems; theories of value; environmental ethics and its neighbors; human stewardship of nature; holism, anthropocentrism and biocentrism compared; biocentric consequentialism (Attfield's preference); critiques of environmental ethics. Can environmental ethics make a difference? Taking the future seriously. Do human interests and environmental responsibilities converge? Sustainable development; population, and precaution; the global community and global citizenship. A most inclusive, global, cosmopolitan, universal ethic. An unexcelled survey and synthesis of the enormous range of challenging issues, and of the literature of their debate. Attfield is in philosophy, University of Wales, Cardiff. (v 14, #3)

Attfield, Robin, "Saving Nature, Feeding People and Ethics," Environmental Values 7(1998): 291-304. Holmes Rolston's case for holding that it is sometimes right to let people starve in order to save nature is argued to be inconclusive at best; some alternative responses to population growth are also presented. The very concept of development implies that authentic development, being socially and ecologically sustainable, will seldom conflict with saving nature (sections 1 and 2). While Rolston's argument about excessive capture of net primary product is fallacious, his view should be endorsed about the wrongness

of 'development' in areas where sustainable development is impossible, but not unqualifiedly endorsed about those areas where it is feasible (section 3). Important as policies promoting sustainable levels of population are, representing population growth as a cancer is misguided, and could engender indifference to suffering (sections 4 and 5). The neo-Malthusian paradigm (which makes population growth the cause of both poverty and environmental degradation) appears to conflict with a considerable body of empirical evidence; the kind of policies needed in Third World countries are ones which enlist people's energies for producing food and preserving nature alike (section 6). KEYWORDS: nature, development, value, ethics, population. Robin Attfield is at University of Wales Cardiff, UK. (EV)

Attfield, Robin, "Unprojected Value, Unfathomed Caves and Unspent Nature: Reply to an Editorial," Environmental Values 14(2005): 513-518. This article replies to Alan Holland's challenge to reconcile belief in non-anthropogenic intrinsic value with the poetry of John Clare and its projection onto nature of human feelings, and thus with projective humanism. However, in literature and broadcasts, feelings are found projected upon buildings and belongings as well as upon natural creatures. This and the fact that many living creatures (such as the Northamptonshire species not remarked by Clare) never become objects of human projections but still remain valuable suggests that the basis of natural value lies elsewhere, at least in part. Such themes, together with that of nature's independent value, are variously illustrated from poems of Gray, Cowper and Marvell, and from expressions of nature's otherness in the Christian verse of Hopkins (who also helps answer Holland's further question concerning 'what we have lost'), and in the pantheistic (or pagan) prose of Grahame's Wind in the Willows. In none of these writers does the value of nature depend on the projection of a humanistic sensitivity, but in different ways on the nature (diversely conceptualised) of natural creatures themselves. Attfield is in philosophy, University of Wales, Cardiff. (EV)

Attfield, Robin. "Has the History of Philosophy Ruined the Environment?" Environmental Ethics 13(1991):127-37. I review and appraise Eugene C. Hargrove's account of the adverse impacts of Western philosophy on attitudes to the environment. Although significant qualifications have to be entered, for there are grounds to hold that philosophical traditions which have encouraged taking nature seriously are not always given their due by Hargrove, and that environmental thought can draw upon deeper roots than he allows, his verdict that the history of philosophy has discouraged preservationist attitudes is substantially correct. Environmental philosophy thus has a significant (if not quite an unrivalled) role to play in the reconstruction of many of the traditional branches of philosophy, as well as in the protection of the natural world. Attfield is at the Philosophy Section, University of Wales College of Cardiff, Cardiff, Wales, UK. (EE)

Attfield, Robin. Value, Obligation, and Meta-Ethics. Atlanta & Amsterdam, Editions Rodopi B. V., 1995. Defends a biocentric theory of moral standing and the coherence and objectivity of belief in intrinsic value, despite recent objections. Intrinsic value is located in the flourishing of living creatures. A theory of priorities, or of relative intrinsic value, in which the satisfaction of basic needs takes priority over other needs and wants, and the interests of complex and sophisticated creatures over those of others. A practice-consequentialist theory of rightness and obligation. Meta-ethical theories are sifted and moral relativism rejected, and a cognitivist and naturalist meta-ethic defended. Attfield teaches philosophy at the University of Wales, Cardiff. (v6,#3)

Attfield, Robin. Review of Environmental Ethics. By Holmes Rolston, III. Environmental Ethics 11(1989):363-68.

Attfield, Robin. "Postmodernism, Value and Objectivity," Environmental Values 10(2001):145-162. The first half of this paper replies to three postmodernist challenges to belief in objective intrinsic value. One lies in the claim that the language of objective value presupposes a flawed, dualistic distinction between subjects and objects. The second lies in the claim that there are no objective values which do not arise within and/or depend upon particular cultures or valuational frameworks. The third comprises the suggestion that belief in objective values embodies the representational theory of perception. In the second half, a defence is offered of belief in objective intrinsic value. Objectivists hold that axiological properties supply interpersonal reasons for action for any relevant moral agent. The intrinsically valuable is understood as what there is reason to desire, cherish or foster in virtue of the nature of the state or object concerned. The concept of intrinsic value is shown to be instantiated, and defended against a range of criticisms. Keywords: Intrinsic value, extrinsic value, postmodernism, objectivity, subjectivism, dualism, representationalism, axiology. Robin Attfield is at the School of English, Communication and Philosophy, University of Wales Cardiff. UK. (EV)

Attfield, Robin. "Beyond the Earth Charter: Taking Possible People Seriously." Environmental Ethics 29(2007):359-367. The Earth Charter is largely a wholesome embodiment of a commendable and globally applicable ecological ethic. But it fails to treat responsibilities toward future generations with sufficient clarity, presenting these generations as comparable to present and past generations, whose members are identifiable, when in fact most future people are of unknown identity, and when the very existence of most of them depends on current actions. It can be claimed that we still have obligations with regard to whoever there will be whom we could affect, and in addition, all the possible people of the future whom we could affect have moral standing, as well as corresponding members of other species. These obligations clash with the person-affecting principle, which considerably restricts such obligations and the scope of moral standing at the same time. Finally, there are implications for sustainability, at least with regard to sustainable levels of population and with regard to global warming, and thus a need for further clarification of the content of responsibilities toward future generations. Austin, Richard Cartwright. Beauty of the Lord. Reviewed in Environmental Ethics 11(1989):277-80.

Austin, Richard Cartwright. "Beauty: A Foundation for Environmental Ethics." Environmental Ethics 7(1985):197-208. Human awareness of natural beauty stimulates the formation of environmental ethics. I build from the insights of Jonathan Edwards, the American Puritan theologian. The experience of beauty creates and sustains relationships. Natural beauty is an aspect of that which holds things together, supporting life and individuation. Beauty joins experience to ethics. We experience beauty intuitively: it is an affecting experience which motivates thought and action. The experience of beauty gives us a stake in the existence of the beautiful. Ecology can explore the relationships of natural beauty scientifically: it may be a science of the beauty of the Earth. The beauty of the world is necessary to its survival. Beauty is manifest in the interplay of interdependence with individuality, yielding diversity. The most beautiful relationships are those which recognize diversity, support individuality, and empathetically span the distinctions between beings. The sense of beauty is not a luxury, but a distinctive human vocation. Austin is an environmental theologian with Holston Presbytery, Dungannon, VA. (EE)

Ayres, Robert U., Jeroen C. J. M. van den Bergh, and John M. Gowdy. "Strong versus Weak Sustainability: Economics, Natural Sciences, and "Consilience." Environmental Ethics 23(2001):155-168. The meaning of sustainability is the subject of intense debate among environmental and resource economists. Perhaps no other issue separates more clearly the traditional economic view from the views of most natural scientists. The debate currently focuses on the substitutability between the economy and the environment or between "natural capital" and "manufactured capital" a debate captured in terms of weak versus strong sustainability. In this article, we examine the various interpretations of these concepts. We conclude that natural science and economic perspectives on sustainability are inconsistent. The market-based Hartwick-Solow "weak sustainability" approach is far removed from both the ecosystem-based "Holling sustainability" and the "strong sustainability" approach of Daly and others. Each of these sustainability criteria implies a specific valuation approach, and thus an ethical position, to support monetary indicators of sustainability such as a green or sustainable Gross Domestic Product (GDP). The conflict between "weak sustainability" and "strong sustainability" is more evident in the

context of centralized than decentralized decision making. In particular, firms selling "services" instead of material goods and regarding the latter as "capital" leads to decisions more or less consistent with either type of sustainability. Finally, we discuss the implications of global sustainability for such open systems as regions and countries. Open systems have not been dealt with systematically for any of the sustainability criteria. (EE)

Babbitt, Bruce, "Kudzu, Kudzu, Kill! Kill! Kill!" Harper's Magazine (July 1998): 17-18. Secretary of Interior Bruce Babbitt believes fighting "invasive alien species" can bring people together. According to Babbitt, weeds cause environmental havoc on a scale only matched by floods, earthquakes, mud slides, hurricanes, and fire. They infest 100 million acres in the U.S. (an area equivalent in size to a square with 400-mile sides) and are spreading at a rate of 14 percent per year. Weeds "homogenize the diversity of creation," threaten native plants and animals with extinction, erode soil, spread wildfire, ignore borders and property lines, and damage property values. Speaking before the Science in Wildland Weed Management Symposium, Babbitt said, "Weeds slowly, silently, almost invisibly, but steadily, spread all around us until, literally encircled, we can no longer turn our backs. The invasion is now our problem. Our battle. Our enemy. ... The invasion and spread of noxious alien weeds unites us. It unites across political, economic and property boundaries. It brings solidarity among opposing groups. It compels us to share strategic responses. It calls on us to rise above our sometimes petty day-to-day concerns." Babbitt urges everyone to "act now and act as one" in order to "beat this silent enemy." (v9,#2)

Baer, Paul, et al., "Equity and Greenhouse Gas Responsibility," Science 289(2000):2287. Developed countries have agreed to base emissions goals on 1990 levels, and the U.S. insists on "meaningful participation" by the developing countries. But this just grandfathers in existing disproportions. Global carbon emissions average one metric ton per year per person; developed nations emit three to five, the U.S. five. Developing nations emit about .6, though many of them only .2. When the global population reaches ten billion as currently estimated, per capita emissions must be stabilized at .3 per person per year. A more just principle would be to base emissions on a per capita basis. This is simple and it gives each person equal access to and responsibility for the atmosphere. The authors are (mostly) with the Energy and Resources Group, University of California at Berkeley. But, replies Arthur Westing, this proposal just grandfathers in existing population excesses, no better than grandfathering in existing development excesses. A more equitable proposal is to allocate a country's emissions total on the basis of the airspace over that country. See Arthur H. Westing, "Atmospheric Ethics," Science 291(2001):827. (EE v.12,#1)

Bagla, Pallava, "Indian Activists Release Disputed Report," Science 309(30 September 2005):2146. A report commissioned by the Indian Ministry of Environment and Forests has prepared a 1,300 page report on biodiversity in India, but the government does not want the report released. The group plans to defy the order not to release it and to release it anyway. The report was prepared with funds from the Global Environment Facility and with the co-operation of the India office of the United Nations Development Programme (UNEP). The report concludes that "India's model of development is inherently unsustainable and destructive to biodiversity." Government officials consider the report inaccurate in part and also an embarrassment.

Bagla, Pallava, "50 Monkeys Taken from Indian Lab," Science 285(1999):997. India and experiments on monkeys. Armed with a government order and escorted by police, animal activists took 50 rhesus monkeys from India's National Center for Laboratory Animal Sciences in Hyderabad and released them into the wild. The monkeys were to have been used in testing a potential drug against immune disorders. India has new regulations on the care of animals used in research, and the laboratory was not meeting those standards. Researchers protest that half of India's research of this kind could be shut down. (v. 10, # 3)

Bagla, Pallava. "Controversial Rivers Project Aims to Turn India's Fierce Monsoon into a Friend." Science Vol. 313, no. 5790 (25 August 2006): 1036-37. Bagla discusses a controversial project to divert monsoon runoff from twelve rivers in eastern India to parched western states involving relocating tens of thousands of people.

Bailey Catherine, "Africa Begins at the Prynees': Moral Outrage, Hypocrisy, and the Spanish Bullfight," Ethics and the Environment 12(no. 1, 2007):23-37. The long history of criticism directed at bullfighting usually suggests that there is something especially morally noxious about it. I analyze the claims that bullfighting is distinctively immoral, comparing it to more widely accepted practices such as the slaughtering of animals for food. I conclude that, while bullfighting is horrific, the emphasis on it as especially "uncivilized" may serve to disguise the similarities that it has with other practices that also depend on animal suffering. I conclude that, for many, the hypocritical maintenance of a self-image as "civilized," despite great moral crimes committed against animals, seems to be facilitated by a focus on this especially dramatic example of animal cruelty. Bailey is at Minnesota State University.

Bailey, Cathryn, "On the Back of Animals: The Valorization of Reason in Contemporary Animal Ethics," Ethics and the Environment 10(no. 1, 2005):1-18. Despite the fact that feminists have compellingly drawn connections between traditional notions of reason and the oppression of women and nature, many animal ethicists fail to deeply incorporate these insights. After detailing the links between reason and the oppression of women and animals, I argue that the work of philosophers such as Tom Regan and Peter Singer fails to reflect that what feminists have called is not the mere inclusion of emotion, but a recognition of the inherent continuity between the two. To ignore this continuity, I conclude, risks reinscribing the very suffering we seek to eliminate. Bailey is in philosophy, Minnesota State University, Mankato. (Eth&Env)

Bailey, Ronald, Eco-Scam: The False Prophets of Ecological Apocalypse. St. Martin's. 228 pages. \$ 19.95. Bailey skewers false prophets and their failed forecasts. Paul Ehrlich won a MacArthur Foundation "genius" grant and the Swedish Academy's Crafoord price. He also predicted in 1969 that hundreds of millions would soon perish in smog disasters in New York and Los Angeles, that the oceans would die of DDT poisoning by 1979, and that the U. S. life expectancy would drop to 42 years by 1980 due to cancer epidemics. Lester Brown, another MacArthur genius and Worldwatch Institute president, predicted that global oil production would peak in 1990. Carl Sagan predicted that the Kuwaiti oil fires would lead to a global freeze. The global warming issue, "the mother of all environmental scares" is a another eco-scam. All the risks associated with the ozone layer do not amount to moving more than 100 miles south, from Washington, DC to Richmond, Virginia. Only fifteen years ago, Stephen Schneider, now fearing global warming, was then fearing global cooling. Nor does it make any difference what the eco-catastrophe faced is, the problem is always industrial capitalism. Bailey was formerly a writer with Forbes and is now a producer for the PBS series, "Technopolitics." (v4,#2)

"The destruction of natural environments causes harm to people because it weakens their connections to the natural world. The quantification of nonuse value measures the extent of that harm. Contingent valuation (CV) is the only accessible vehicle thought capable of such

quantification" (p. 714). Responses to four principal criticisms of contingent valuation. "To properly assess nonuse value, the law must reconceptualize the human loss associated with natural resource damage as an emotional injury to the person, not a deprivation of a property right. The loss associated with environmental degradation is the loss that humans experience when their subjective connection to the environment is damaged. The legitimacy of compensating for this loss requires recognizing that the injury does not involve the loss of any individual resource's intrinsic value, but is instead people's sense of loss associated with the destruction of ecosystems. When irreplaceable natural communities are destroyed, the human connection to nature has been injured. Contingent valuation, the current means of assessing the psychological injury associated with natural resource loss, is a crucial vehicle for measuring damages because it allows people to assess their own subjective sense of loss" (p. 728). Baker is professor of law, Chicago-Kent College of Law. (v.10,#2)

Bakken, Peter W., J. Ronald Engel, and Joan Gibb Engel, 1993. Ecology, Justice, and Christian Faith: A Guide to the Literature, 1960-1990. Westport, CT: Greenwood Press. In Press. (v4,#1)

Bakken, Peter W., Joan Gibb Engel, and J. Ronald Engel, Ecology, Justice, and Christian Faith: A Critical Guide to the Literature. Westport, CT: Greenwood Press, 1995. This book can be obtained at 40% discount = \$33 (instead of \$55 list price) from Greenwood Press Order Line 1-800-225-5800. Have credit card information ready. Refer to code #F308 to qualify. Part one is "Critical Survey: The Struggle to Integrate Ecology, Justice, and Christian Faith," a review essay. Part two is a Bibliography Survey, 1961-1993, arranged in eleven categories with 512 entries, each well annotated. There is an author index, a title index, and a subject index. An extensive work, the labor of many years, and valuable for its critical insights. A related work is Joseph K. Sheldon, Rediscovery of Creation: A Bibliographical Study of the

Church's Response to the Environmental Crisis, 1992, which has 1,700 references, also a historical overview, but few critical annotations. Bakken is coordinator of outreach for the Au Sable Institute of Environmental Studies. Joan Engel is a free lance writer and Ronald Engel is professor of social ethics, Meadville/Lombard Theological School. (v7,#1)

Bakken, Peter W., The Ecology of Grace: Ultimacy and Environmental Ethics in Aldo Leopold and Joseph Sittler. Ph.D. dissertation, University of Chicago, Divinity School, August 1991. An influential articulation of a secular environmental ethic, Leopold's Sand County Almanac, invests the natural environment with an aura of ultimacy that grounds that ethic and gives it a subtly but genuinely religious character. A contemporary interpretation of the Christian doctrines of creation, Christ, and grace, in the theology of Joseph Sittler, invests the nonhuman world with a similar aura of ultimacy. Leopold's greater attention to "wildness" can critique Sittler's treatment of grace in nature. But Leopold seems unaware of his dependence on religious or quasi-religious factors, and leaves him unable to provide ultimate answers to the place and role of humans in nature. Christian theology can both be corrected by and add deeper dimensions to Leopold's land ethic. The co-advisors were Robin Lovin and J. Ronald Engel.

Bakken, Peter W., J. Ronald Engel, and Joan Gibb Engel. Ecology, Justice, and Christian Faith: A Guide to the Literature 1960-1993. Westport, CT: Greenwood Press, 1995. An annotated bibliography of literature published in English that expresses, analyzes, or critiques Christian perspectives on the relationship between social justice and ecological integrity. There is an introductory review essay followed by over 460 complete annotations by over 250 authors. The annotations focus on works that include each of the following three components: (1) attention to ecological issues such as environmental quality, resource limitations, and biotic diversity; (2) attention to social-ethical values and problems such as distributive justice, community, racism, and sexism; and (3) explicitly theological or religious reflection on ecological and social ethics and their interrelations. Bakker, J. I. Hans, "The Gandhian Approach to Swadeshi or Appropriate Technology: A Conceptualization in Terms of Basic Needs and Equity", Journal of Agricultural Ethics 3(1990):50-88. This is an examination of the significance of Gandhi's social philosophy for development. It is argued that, when seen in light of Gandhi's social philosophy, the concepts of appropriate technology and basic needs take on new meaning. Gandhi's social philosophy has been neglected by most development specialists. This analysis attempts to draw out some aspects of M. K. Gandhi's background and his thinking about swadeshi (i.e.local self-reliance and use of local knowledge and abilities) and swaraj (i.e.independent development that leads to equity and justice). Bakker is in sociology and anthropology at the University of Guelph, Ontario.

Baldwin, Dwight, Jr., Judith de Luce, and Carl Pletsch, eds., Beyond Preservation: Restoring and Inventing Landscapes. Minneapolis: University of Minnesota Press, 1993. The theory of preservation is predicated on the assumption that as humans we are different from and opposed to the rest of nature, but the contributors here explore the belief that humans are inextricably entangled with nature and therefore have an unavoidable impact upon the entire ecosystem. The contributors explore the possibilities of restoring damaged landscapes and even of inventing new ones. The editors are landscape architects at the University of Miami, Ohio. (v4,#2)

Baldwin, Ian T., et al., "Volatile Signaling in Plant-Plant Interactions: 'Taling Trees' in the Genomics Era," Science 311 (10 February 2004): 812-814. Well, maybe it's more like "eavesdropping." Plants pick up on volatiles released by nearby plants under herbivore attack and prepare their defenses. And those under attack may release volatiles to draw predators on their attacking herbivores. Such signalling can be better tested now because of our ability to genetically modify "deaf" and "mute" plants.

Baldwin, Jeff, "The Culture of Nature through Mississippian Geographies," &e Ethics and the Environment 11(2006):13-44. The paper's first interest is in re-forming exploitive human-environment relations. It shows that culture/nature dichotomies are not only false, but obscure the commonality of culture to humans and nonhuman beings and processes. The paper draws upon the Roman genesis of "culture" to describe its function in finding appropriateness among co-evolving human and nonhuman projects. Culture, thus, is the process through which co-eval projects are brought together. The study argues that through dialectic interrelationships, culture works to move biospheric relations towards mutualism and away from parasitism (or exploitation). This is evident among nonhuman beings and processes as well as cultures in which humans are more central. The paper draws upon various interrelationships in the Mississippi watershed to illustrate these points. It then briefly explores the usefulness of a culture of nature perspective in planning and managing development projects. Baldwin is in earth and environmental studies, Wilamette University, Salem, Oregon. (Eth&Env)

Balmford, Andrew et al (two dozen others), "The Convention on Biological Diversity's 2010 Target," Science 307(14 January 2005):212-213. Short-term, and for people in need or with power, destruction of biological diversity has a beneficial effect on personal well-being. But long-term, conserving biodiversity and the services it provides is essential to human self-interest. How can scientists present information about biodiversity in ways that are useful to making longer-term decisions? Part of the answer is establishing better and more reliable indicators that are rigorous, repeatable, widely accepted, and easily understood. In this respect economists have long had a set of common and clear indicators that track markets. Ecologists need something similar.

Balmford, Andrew et al (eighteen others), "Economic Reasons for Conserving Wild Nature," Science 297(9 August 2002):950-953. "On the eve of the World Summit on Sustainable Development, it is timely to assess progress over the 10 years since its predecessor in Rio de Janeiro. Loss and degradation of remaining natural habitats has continued largely unabated. However, evidence has been accumulating that such systems generate marked economic benefits, which the available data suggest exceed those obtained from continued habitat conversion. We estimate that the overall benefit/cost ratio of an effective global program for the conservation of remaining wild nature is at least 100:1." "Development is clearly essential. However, current development trajectories are self-evidently not delivering human benefits in the way that they should: income disparity world-wide is increasing and most countries are not on track to meet the United Nations' goals for human development and poverty eradication by 2015. ... Retaining as

much as possible of what remains of wild nature through a judicious combination of sustainable use, conservation, and, where necessary, compensation for resulting opportunity costs ... makes overwhelming economic as well as moral sense." Balter, Michael, "The Baby Deficit," Science 312(30 June 2006):1894-1897. As fertility rates decline across the developed world, governments are offering big incentives for childbearing. Experts don't expect them to have much effect. Demographers predict that the E.U. countries will lose between 24 million and 40 million people during each coming decade. Replacement level total fertility rates in European countries are 2.1 children per couple, and nearly all the world's industrialized countries are below this, some much below. The U.S. is at replacement level. Below replacement levels also mean that a population ages, the proportion of elderly adults relative to the active labor force increases, making a higher economic burden on the active labor force to support the elderly.

On global scales, demographers predict that the world's total population will continue to increase for decades to come, rising from its current 6.5 billion to somewhere between 8 and 11 billion by 2050. But nearly all of the increase will be in developing countries.

Balvanera, Patricia et al (eight others), "Conserving Biodiversity and Ecosystem Services," Science 291(2001):2047. A lead editorial in Science. "Above all, we must remember that biodiversity is in serious jeopardy for a reason: namely, that the opportunity costs of conservation are perceived to be too high. The best hope for biodiversity is to create and align diverse incentives for conservation wherever possible and to integrate these into the larger policy-making arena." (v.12,#2)

Bammel, Gene, "Which World? Which Wilderness? or Getting Back to the Right Cronon," International Journal of Wilderness 7 (no. 2, August 2000):16-19. William Cronon is a heretic. But heretics often serve as useful correctives. Heretics serve to bring the orthodox back to their roots. Perhaps Crononism will serve to bring true believers in wilderness back to the bedrock of their belief and practice. Bammel is emeritus professor of philosophy, West Virginia University. (v.12,#4)

Bao Qingde, "Replacement and Transformation: Sustainable Development and the Evolution of the Conception of Development." Huanjing yu Shehui, a Quarterly, (Environment and Society), vol. 3, no. 4 (December 30, 2000). Abstract: The idea of sustainable development represents a major shift in people's conception of development. Its essence is a thorough replacement and innovative transformation of peoples' values regarding social development. The focus of this paper is to clarify the origins of the idea of sustainable development and its connotation, and to give an overview of such issues as the evolution of people's conception of development. In Chinese. (EE v.12,#1)

Barbanell, Edward Morris, Private Property and Common-property Arrangements: The Case of Water in the West, Pd.D. thesis, Department of Philosophy, University of Utah, 1999. Private ownership is not the preferred end state for all scarce resources, illustrated by water in the American West. Because of water's "factor endowments", e.g., its degrees of jointness, divisibility and excludability, one individual's use creates significant negative externalities for other users. Individuals' interests can be better protected by splitting the various rights of ownership between individual resource users and the "resource community" to which they belong. This dissertation offers an expanded framework of "ownership", or rights-relationships. Locke's account of property is inadequate for water and other resources with similar factor endowments. Economists often conflate "open access" with "common ownership." The former describes a state of affairs where there are no rights-relationships at all, whereas the latter denotes a situation where definite property rights have been established. When the rights-relationship among members of a resource community is based on shared expectations of reciprocal behavior, then a common-property arrangement can function effectively to control the overuse of scarce resources. The advisor was Bruce Landesman. (v.13,#4)

Barbato, Joseph and Lisa Weinerman, eds., Heart of the Land: Essays on the Last Great Places. New York: Pantheon Books, 1994. 297 pages. A Nature Conservancy sponsored book. Thirty essays by well-known nature writers about places that still retain the ability to inspire, to awe, and to fire our collective imaginations. The essayists find that such places move us in ways that we intuitively understand but cannot adequately explain. Samples: Terry Tempest Williams, "Winter Solstice at the Moab Slough (Colorado Plateau, Utah)"; Rick Bass, "On Willow Creek" (Texas Hill Country); Joel Achenbach, "The Most Patient of Animals" (Clinch Valley, Virginia). "Of course we shouldn't protect a wild core such as the Texas hill country because it is a system still intact with the logic and sanity that these days too often eludes our lives in the city. We should instead protect the hill country simply for its own sake, to show that we are still capable of understanding (and practicing) the concept of honor: loving a thing the way it is, and trying, for once, not to change it" (Rick Bass). Barbato is an editorial director at the Nature Conservancy; Weinerman is with Nature Conservancy in Latin America. (v7,#1)

Barbier, Edward B., "The Concept of Sustainable Economic Development," Environmental Conservation 14(no. 2, Summer, 1987):101-110. Sustainable development is perhaps a difficult concept to define with analytical rigor but it is nevertheless a useful concept. One makes an effort to maximize simultaneously goals in three areas (1) Biological system goals, such as genetic diversity, resilience, biological productivity; (2) Economic system goals, such as satisfying basic needs, reducing poverty, equity-enhancing, increasing useful goods and services; and (3) Social system goals, such as cultural diversity, institutional sustainability, social justice, and participation. This forces tradeoffs, since all these goals cannot at once be maximized, and optimum solutions can be sought. Barbier is with the International Institute for Environment and Development, London.

Barling, David , "Food Supply Chain Governance And Public Health Externalities: Upstream Policy Interventions and the UK State," *Journal of Agricultural and Environmental Ethics* 20(2007):285-300. Contemporary food supply chains are generating externalities with high economic and social costs, notably in public health terms through the rise in diet-related non-communicable disease. The UK State is developing policy strategies to tackle these public health problems alongside intergovernmental responses. However, the governance of food supply chains is conducted by, and across, both private and

public spheres and within a multilevel framework. The realities of contemporary food governance are that private interests are key drivers of food supply chains and have institutionalized a great deal of standards-setting and quality, notably from their locations in the downstream and midstream sectors. The UK State is designing some *downstream* and some *midstream* interventions to ameliorate the public health impacts of current food consumption patterns in England. The UK State has not addressed *upstream* interventions towards public health diet at the primary food production and processing stages, although traditionally it has shaped agricultural policy. Within the realities of contemporary multilevel governance, the UK State must act within the contexts set by the international regimes of the Common Agricultural Policy and the World Trade Organization agreements, notably on agriculture. The potential for further upstream agricultural policy reform is considered as part of a wider policy approach to address the public health externalities issuing from contemporary food supply chains within this multilevel governance context. Keywords: The State - agricultural policy and public health - food governance - World Health Organization. Barling is at Centre for Food Policy, City University, London, UK.

Barlow, Chuck D., "Why the Christian Right Must Protect the Environment: Theocentricity in the Political Workplace," The Boston College Environmental Affairs Law Review 23 (no. 4, Summer, 1996):781- . Originally a LL.M. (Master of Laws) thesis, in the environmental law and natural resources program at the Northwestern School of Law of Lewis & Clark College, Portland, Oregon, December 1995. The faculty advisor was Professor William Funk. Analyzes the rise of the Christian right as a force in American political policy, demanding adherence to traditional Biblical values. The Christian right has taken, at best, an indifferent, and at worst, a heavily anthropocentric attitude toward the use and conservation of the environment. Barlow rebuts the proposition, asserted by Lynn White, Jr., Aldo Leopold, and others, and implicitly accepted by the environmental inaction of the Christian right, that the scriptures of the Judeo-Christian tradition promote an anthropocentric environmental ethic. Rather, the Bible sets forth a "theocentric," or God-centered, approach to care of the environment. Those who claim to base their political agenda on Christianity ought to consider the Biblical mandate to use the earth's resources wisely. Address: Chuck D. Barlow, c/o Phelps Dunbar, L.L.P., P.O. Box 23066, Jackson, MS 39225-3066. (v.7,#4)

Barnard, Helen. *Nature, Human Nature and Value*. Ph.D. Dissertation, Cardiff University, 2006. The main concern of environmental philosophy has been to find value for nature. This thesis links a theory of nature, a theory of human nature and a theory of value. A definition of nature is explored, requiring a brief history of the concept of nature. There has been a decline of teleological explanations and the development of two main contemporary explanations of human nature in relation to nature: Ultra-Darwinism (a reductionist explanation of human nature) and postmodernism. An analysis of these two positions shows that neither has an adequate metaphysics for finding value in nature, and this is revealed by an examination of two different types of environmental philosophy influenced respectively by the two opposing views. The problem of values is discussed with particular emphasis on moral values. An argument for objective values based on objective knowledge is put forward as well as a theory of human nature which leads to the conclusion that teleological explanations link a theory of nature, a theory of human nature, and a theory of value more satisfactorily than the non-teleological explanations of Ultra-Darwinism and postmodernism. This conclusion is relevant to the problems of the environment. The advisor was Robin Attfield.

"Seasonal Recruitment of Hippocampal-Neurons in Adult Free-Ranging Black-Capped Chickadees." *Proceedings of the National Academy of Sciences of the United States of America* Vol. 91, no. 23 (1994): 11217-21. Chickadees develop new neurons before the stress of winter, hiding food before onset of winter and needing new neurons to remember where to find it. Interestingly, chickadees living in the wild produce double the number of neurons of chickadees that are kept as captive birds. Does wild nature builds better brains, or at least better bird brains? Similar studies have found that the brains of lions kept in zoos have much degenerated. The authors are in the Field Research Center for Ecology and Ethology at Rockefeller University.

Barr, James. Biblical Faith and Natural Theology. Oxford: Clarendon Press, 1993. 244 pages. Writing against the background of the rejection of natural theology by prominent twentieth century theologians (especially Karl Barth), Barr, well-known for his biblical exegesis, argues that natural theology is a legitimate enterprise within biblical thought. Any religious claim, no matter how strongly defended as revealed, includes some element of "anterior knowledge" that arises out of what has traditionally been viewed as natural theology. Natural theology is an essential and lively component of Biblical faith. Unfortunately, Barr chooses not to bring his new regard for natural theology to bear in any substantial way on the new discussions of the world and nature prompted by the ecological crisis. Barr presented these as Gifford lectures in 1991; an earlier Gifford lecturer denying natural theology was Karl Barth in 1938. (v6,#3)

Barrett, Christopher B., and Ray Grizzle. "A Holistic Approach to Sustainability Based on Pluralism Stewardship." Environmental Ethics 21(1999):23-42. In this paper, we advance a holistic ecological approach based on a three-compartment model. This approach favors policy initiatives that lie at the intersection of the three major areas of concern common to most environmental controversies: environmental protection, provision of basic human needs, and advancing economic welfare. In support of this approach, we propose a "pluralistic stewardship" integrating core elements of anthropocentrism, biocentrism, and ecocentrism. After presenting the basics of our model, we then explain why it is important to identify and promote a holistic ecological approach to sustainability. Here we employ the economic concept of path dependence, emphasizing that there exist multiple paths society can follow in environmental ethics and policy but once one has been chosen, implicitly or explicitly, there may be little opportunity to reverse such choices. Barringer, Felicity, "Unusual Alliance Is Formed to Clean Up Mine Runoff, New York Times, August 18, 2004, A13. In Utah unexpected alliances (ski resort operators, businesses, the U.S. Forest Service, and environmental groups) are co-operating to clean up the U.S. West, where mining waste has polluted the headwaters of 40 percent of all watersheds. (v. 15, # 3)

Barringer, Felicity, "A Search for Pearls of Wisdom in the Matter of Swine," New York Times, July 7, 2004, p. A4. Pig farms in eastern North Carolina produce massive wastes in land, water, and air and have become one of the most politically divisive issues in the state. During the 1990's the number of hogs grew from three to over nine million. Systems to deal with the waste, using lagoons and spraying treated wastes onto fields--the wastes do contain phosphorus and nitrogen, the main ingredients in fertilizer--has repeatedly failed. The EPA has done little and the State of North Carolina has mandated a study to which industry has contributed \$ 18 million. That study, two years overdue, is about to be released, lead by C. M. Williams of North Carolina State University. The better the solutions are, the more expensive they are. (v. 15, # 3)

Barringer, Felicity, "Forest Service Seeks Limits on All-Terrain Vehicles," New York Times, July 8, 2004, p. A12. The U.S. Forest Service is proposing that ATV's must stay on established trails, rather than drive anywhere they please, creating "outlaw" trails. Such non-trails now cover five times as many miles as the proper trails. ATV riders particularly like the challenge of steep slopes and this creates much erosion. ATV use has increased sevenfold in the past thirty years. Some of the 155 National Forests already require staying on trails, but many do not. ATV use has increased sevenfold in the past thirty years. One rider, asked about the appeal of riding in the mud, said, "I like getting muddy. If you haven't gotten muddy, you haven't ridden." (v. 15, # 3)

Barringer, Felicity, "Logging and Politics Collide in Idaho," New York Times, August 9, 2004, A10. Roadless area disputes, resulting from President Bush's plan to withdraw a Clinton ban. (v. 15, # 3)

Barringer, Felicity and Michael Manofsky, "G.O.P. Plans to Give Environmental Rules a Free-Market Tilt," New York Times, November 6, 2004, p. A14. The Bush administration intends to accelerate conservation by distributing billions of dollars to private landowners for the preservation of wetlands and wildlife habitat. Michael O. Leavitt, administrator of the Environmental Protection Agency, said: "We will make more progress in less time while maintaining the economic competitiveness for the country. That's my mission." (v.14, #4)

Barringer, Felicity, "U.S. Rules Out Dam Removal To Aid Salmon," New York Times, December 1, 2004, p. A1. The Bush administration has ruled out removing any dams on the Columbia and Snake Rivers to save endangered salmon species, even as a last resort. Previous Clinton administration policy has stated that dam removal might be an option, as a last resort. Authorities now claim it is unrealistic to consider removing dams and that they can solve the problem with better fish ladders and other solutions. (v.14, #4)

Barringer, Felicity, "New Provision Would Allow Slaughtering of Wild Horses," New York Times, November 25, 2004, p. A20. A provision attached to an Omnibus Spending Bill by Senator Conrad Burns, Republican, Montana, would allow the sale for slaughter of feral horses that have been rounded up and are more than ten years old or have been offered for adoption successfully three times. The bill is

awaiting final action. There are about 37,000 feral horses and burros running free in ten U.S. Western states; most are in Nevada. The Bureau of Land Management rounds up some when numbers increase and now has about 30,000 horses in holding areas. The feral horses compete with livestock and elk for grass. In some areas of Nevada wild animals, including horses, had consumed two-thirds of the available forage before cattle were let onto the land at the end of winter. This time it is the cattlemen, not the ecologists, who want the horses thinned off the landscape. B.L.M. prefers adoption; over 203,000 horses and burros have been adopted in three decades; about 6,600 were adopted last year. But there are many more horses than persons willing to adopt them. (v.14, #4)

Barringer, Felicity, "U.S. Panel Recommends No Protection for Grouse," New York Times, December 3, 2004, p. A 14. Amid an intense lobbying effort by energy and ranching interests in the U.S. West, a team of Interior department biologists has recommended that the sage grouse, a bird whose sagebrush territory has been vastly reduced by farming and development is not threatened with extinction and does not for the moment need to be protected under the Endangered Species Act.

Barringer, Felicity, "Steps Taken to Help Eagle Leave Endangered List," New York Times, February 14, 2006. U.S. Fish and Wildlife is resuming efforts to remove the bald eagle from the endangered species list, with cooperation of environmental groups. One problem, raised by developers, is whether two earlier laws protecting the eagle make it even more difficult for developers. Bald eagles in the U.S. numbered 413 breeding pairs in 1963; today there are 7,000-9,000 breeding pairs.

Barro, Susan C.; Manfredo, Michael J.; and Peterson, George L. "Examination of the Predictive Validity of CVM (Contingent Valuation) Using an Attitude-Behavior Framework." Society and Natural Resources 9, no.2 (1996): 111. (v7, #3)

Barrows, Paul L., "Wildlife Health: When to Intervene," Transactions of the Fifty-Seventh North American Wildlife and Natural Resources Conference, 1992, pages 433-438. When is intervention appropriate and to what degree in the treatment of wildlife diseases? Some advocate a laissez faire attitude, let nature take its course; but others believe we ought to rehabilitate each sick, injured, or dying wild bird or animal encountered. Reason and practicality lie between these extremes. Examples of intervention are discussed, both at the individual and population level, also reports from organizations and study symposia on this issue. Colonel Barrows is commanding officer of the U.S. Army Veterinary Command with a special interest in the welfare of wildlife on military reservations. (v5,#4)

Barry, Dwight, and Oelschlaeger, Max, "A Science for Survival: Values and Conservation Biology," Conservation Biology 10(no. 3, June 1996):905-911. Practice of conservation biology that does not actively and continuously question the values that shape it is self-defeating. Conservation biology is inescapably normative. Advocacy for the preservation of biodiversity is part of the scientific practice of conservation biology. Conservation biologists should reflect on the constitutive values underlying their research programs and policy recommendations. Such reflection is itself an inherent element of scientific objectivity and takes into account the social nature of scientific knowledge. Without openly acknowledging such a perspective, conservation biology could become merely a subdiscipline of biology, intellectually and functionally sterile and incapable of averting an anthropogenic mass extinction. Barry is in the School of Forestry and Environmental Studies, Yale University. Oelschlaeger was then in philosophy, University of North Texas, and now is at the University of Northern Arizona. Bartholow, John M., Douglas, Aaron J., and Taylor, Jonathan G. "Balancing Hydropower and Environmental Values: The Resource Management Implications of the US Electric Consumers Protection Act and the AWARETM Software." Environmental Values 4(1995):255-270. This paper reviews the AWARETM software distributed by the Electric Power Research Institute (EPRI). The program is designed to facilitate the Federal Energy Regulatory Commission (FERC) license renewal process for US hydropower installations. The discussion reviews the regulatory, legal, and social contexts that give rise to the creation and distribution of AWARETM. The principal legal impetus for AWARETM is the Electric Consumer Protection Act (ECPA) of 1986 that directs FERC to give equal consideration to power and non-power resources during relicensing. The software is reviewed in this paper from several perspectives including those of natural resource economics, systems modeling, and the social context within which FERC licensing decisions are made. We examine both the software and its underlying methodology and find significant problems with each. Because of its flaws, AWARETM does little to further ECPA's equal consideration requirement. We find that the conservation and restoration impact of ECPA for US fisheries could be seriously hampered by the widespread use of AWARETM. KEYWORDS: AWARETM, Electric Consumer Protection Act, hydropower, water resources, Federal Energy Regulatory Commission. The changes that might result from global warming are difficult to predict but models indicate they will be as great or greater than those seen in the paleoecologic record during previous warming intervals, and will likely exceed the capacities of present species to adjust to them, resulting in communities without any analogue in present-day vegetation. The authors are in geography, University of Oregon. (v8,#2)

Bartlett, Robert V. "Ecological Rationality: Reason and Environmental Policy." Environmental Ethics 8(1986):221-39. Ecological rationality is a concept important to most environmental and natural resources policy and to much policy-relevant literature and research. Yet ecological rationality as a distinctive form of reason can only be understood and appreciated in the context of a larger body of work on the general concept of rationality. In particular, Herbert Simon's differentiation between substantive and procedural rationality and Paul Diesing's specification of forms of practical reason are useful tools in mapping and defining ecological rationality. The significance and characteristics of ecological rationality suggest that it is a fundamental kind of reason, having precedence over others. Bartlett is in the department of Political Science, Purdue University, West Lafayette, IN. (EE)

Bartlett, Robert V., "Ecological Rationality: Reason and Environmental Policy," Environmental Ethics 8(1986):221-239. By analyzing the concept of rationality itself, we can see that one form of rationality ecological rationality--is fundamental, a necessary condition for human social life. (Katz, Bibl # 1)

Barton, Harry, "The Isle of Harris Superquarry: Concepts of the Environment and Sustainability," Environmental Values 5(1996):97-122. In 1991 Redland Aggregates Ltd. put forward a proposal to embark upon the largest mining project in Europe, the chosen location being the remote island of Harris and Lewis in the Western Isles of Scotland. The proposal sparked off an impassioned debate between planners, conservationists and developers, while the local residents have attempted to come to terms with an operation on a scale previously inconceivable on the island. This paper attempts to examine the proposed development from a sociological angle. It is less concerned with justifying or condemning the project on economic or political grounds and more with analyzing the roots of the various viewpoints held by those involved, willingly or unwillingly, in the debate. From this analysis arise implications regarding different perspectives on the environment and different interpretations of the term sustainable. It is argued that these diverse perceptions are grounded in different interpretations of the environment, shaped by the cultural and historical context within which the groups or individuals that hold these views exist and interact. Ultimately, the paper makes a plea for a wider recognition of the diversity of meanings and interpretations implied by the term environment, a broader definition of the term development, and an expansion of the concept of sustainability to incorporate the variety of situations and perceived needs of different cultures. KEYWORDS: Cultural theory, empowerment, Isle of Harris, sustainability (EV)

Bascompte, Jordi, Pedro Jordano, and Jens M. Olesen, "Asymmetric Coevolutionary Networks Facilitate Biodiversity Maintenance," Science 312 (21 April, 2006): 431-433. In a study of pollinators and fruit-eating birds in forests in Spain, the authors find mutualistic webs but with asymmetric dependency. A plant may require a particular bird to distribute its seed (strong dependency) but that bird may eat the seeds of many kinds of plants (weak dependency), generalists versus specialists. The argument is that this mutualistic asymmetry tends to stabilize the coevolution of the whole ecosystemic network. The lead author is an ecologist in Seville, Spain. With commentary, John H. Thompson, "Mutualistic Webs of Species," Science 312 (21 April, 2006): 372-373.

Bates, Jennifer. "An Inquiry into the Nature of Environmentally Sound Thinking." Environmental Ethics 25(2003):183-197. Many philosophers advocate a change in our thinking in order to move beyond an anthropocentric view of the environment. In order to achieve the kind of thinking that makes for sound environmental thinking, we have to look more deeply into the nature of thought and to revise the relation between thought directed outward to the world and thought directed inwardly to thought itself. Only with such insight can we begin to think soundly about the environment. Thought exhibits a characteristic that makes it hard to think environmentally soundly. This characteristic is the inability to think of something without at the same time making it one's property. In other words, if sound environmental thinking means moving beyond anthropocentric attitudes and, for example, extending moral categories to creatures other than humans, then we need to address how our thinking turns everything into "mine" before we go about establishing a theory about how that extension should take shape. Hegel is the philosopher who most deeply analyses the inevitable, yet dangerous role of "mining"—in the sense of "making mine," in the act of thinking. This potentially problematic character of thought risks making a number of otherwise sound environmental ways of thinking, unsound. However, we can provide a balance for this problematic characteristic in our thinking. (EE)

Study on the possible implications of the cosmological anthropic coincidence), Faculdade de Letras da Universidade de Lisboa, 2000. M.A. thesis on cosmology and environmental ethics. This study is about the ethical implications of the cosmological anthropic principle and of John Gribbin's theory that defends the Universe as alive. These two theories, both based on the cosmological anthropic coincidence, have been put forward during the last four decades and are cosmological conceptions about the place of man and intelligent life in the Universe, having strong ethical implications. However, only the ethical implications of the anthropic principle's weak version are really acceptable because only this version has scientific credibility, being able to play an important role in environmental ethics. (v.12,#4)

Bauckham, Richard, "Joining Creation's Praise of God," Ecotheology 7 (No 1 July 2002):45-59. In the Bible and the Christian tradition an important aspect of the way the relationship of God, humanity and other creatures is understood is the idea that all creatures praise God and humans are to join in the praise offered by the other creatures. This theme has been misunderstood and neglected in the modern period. We should avoid distorting it in an hierarchical and anthropocentric direction, as happens in the idea that humans are the priests of creation. Instead this theme should act as a strong corrective to hierarchical and anthropocentric views of creation, It puts us among, rather than over the creatures, and encourages us to be helped in our own praise of God by appreciating the value other creatures have for God. Francis of Assisi and the eighteenth-century poet Christopher Smart are fine exemplars of the way humans may join creation's praise.

Bauman, Whitney A. "The "Eco-Ontology" of Social/ist Ecofeminist Thought." *Environmental Ethics* 29(2007):279-298. The epistemological and ontological claims of social/ist ecofeminist thought (a combination of social and socialist ecofeminism) are moving away from the dichotomy between idealism and materialism (both forms of colonial thinking about humans and the rest of the natural world). The social/ist ecofeminists have constructed a postfoundational "eco-ontology" of nature-cultures (Haraway) in which the ideal and the material are co-agents in the continuing process of creation. Given that contemporary public discourse in the United States on the topic of "environmental issues" is still heavily shaped by Christian theology and metaphors, changing or challenging this discourse must also mean speaking theologically. Based upon an understanding of social/ist ecofeminist "eco-ontology," a new understanding of God (ideal) and Creation (material) can be constructed which suggests that God is a human horizon that helps reconnect (religion/re-ligare) Christian humans with the rest of the natural world and with the many human "others" of different religious traditions. In this construction, Carolyn Merchant's understanding of humans as "partners" with nature and Catherine Keller's postcolonial critique of the Christian doctrine of creation out of nothing are the most helpful. (EE)

Bauman, Zygmunt. *Consuming Life*. Cambridge: Polity Press, 2007. Bauman examines the impact of consumerist attitudes and patterns of conduct on communities and partnerships, identity building, politics and democracy, the production and use of knowledge, and social divisions and stratifications. He discusses the invasion and colonization of human relations by the worldviews and behavioral patterns shaped and inspired by commodity markets and the sources of dissent, resentment, and resistance to occupying forces.

Baumgartner, Christoph, "Exclusion by Inclusion? On Difficulties with Regard to an Effective Ethical

Assessment of Patenting in the Field of Agricultural Bio-Technology." Journal of Agricultural and Environmental Ethics 19(2006):521-539. In order to take ethical considerations of patenting biological material into account, the so-called "ordre public or morality clause" was implemented as Article 6 in the EC directive on the legal protection of biotechnological inventions, 98/44/EC. At first glance, this seems to provide a significant advantage to the European patent system with respect to ethics. The thesis of this paper argues that the ordre public or morality clause does not provide sufficient protection against ethically problematic uses of the patent system within the area of life. On the contrary, there are worrisome obstacles to any effective and comprehensive critical analysis of the ethical aspects of bio-patenting, especially in the field of agriculture. These obstacles can be seen as indirect consequences of the implementation of ethical considerations in form of the ordre public and morality clause in the EC Directive. Therefore, Article 6 of the EC Directive on the legal protection of biotechnological inventions seems to ultimately weaken the position of ethics in the debate concerning bio-patenting because the ordre public and morality clause is usually interpreted in an exclusively bio-ethical way in the sense of an "intrinsic ethics," which is primarily interested in questions regarding the moral status of particular entities. It is argued that an important cause of this phenomenon is that the decisive reasons against bio-patenting are concerns of social ethics, and not bio-ethics. Keywords: agricultural bio-technology - EC bio-patenting directive-ethics - ordre public and morality clause - patents. In 1993, the Malaysian government revived its plans for a huge hydroelectric project in Sarawak, Malaysia--the Bakun dam--and announced that it would be built with private (rather than public) money. Private finance has not been forthcoming, however. Direct and indirect government subsidies are now bailing the project out. Many Malaysians have expressed concern at the consequences of "privatization" in the country and the ways in which Bakun has entrenched unaccountable political-corporate networks.

Baxter, Brian, Ecologism: An Introduction. Edinburgh: Edinburgh University Press, and Washington: Georgetown University Press, 2000. Articulates and defends "ecologism"--an ideology that has grown from the developing interest in the moral, political, economic, and scientific issues centering on human relationships with the environment. Ecologism starts from the position that the non-human world is worthy of moral consideration and that this should be taken into account in the ordering of social, economic and political systems. Ecologism is a major development in environmental politics and, increasingly, a significant alternative to existing political philosophies. A comprehensive and systematic survey of the main components ecologism, examining elements which have been neglected in the existing literature. (v.11,#2)

Baxter, Brian H., "Naturalism and Environmentalism: A Reply to Hinchman," Environmental Values 15(2006): 51-68. The values which are definitive of the humanist project, such as freedom and self-determination, are of central concern to environmentalism. This means, according to Lewis P. Hinchman, that environmentalists should seek a rapprochement with humanism, rather than rejecting it for its apparent anthropocentrism. He argues that this requires in turn the acceptance of those approaches to human self-understanding which are central to the hermeneutic traditions and the rejection of naturalist approaches, such as sociobiology, which is accused of producing deterministic, reifying, reductionist, dehumanising forms of understanding of human beings and human life. This paper seeks to show that sociobiology does not pose the kinds of threat to humanism and environmentalism outlined by Hinchman. (EV)

Baxter, Brian H., "Ecocentrism and Persons," Environmental Values 5(1996):205-219. Ecocentrism has to establish an intrinsic connection between its basic value postulate of the non-instrumental value of the

nonhuman world and a conception of human flourishing, on pain of failure to motivate acceptance of its social and political prescriptions. This paper explores some ideas recently canvassed by ecocentrists such as Robyn Eckersley, designed to establish this connection--transpersonal ecology, autopoietic value theory and ecofeminism--and finds them open to objection. An alternative approach is developed which concentrates on the connection between non-human nature and personhood, via the phenomenon of culture. Persons are conceived of as essentially culture-creators, and the fact of their embodiment in ecosystems is argued to be essential to their activities as culture creators. The variety and integrity of such systems thus turns out to be essential for the flourishing of what is essential to personhood. This means that ecocentrism has to be abandoned in its pure form, and replaced with person-centrism, but this conclusion is argued for on the basis of the extension of the concept of the self--a strategy often endorsed by ecocentrists themselves. KEYWORDS: Ecocentrism, environmental ethics, intrinsic value theory, persons (EV)

Baxter, Brian. "Environmental Ethics - Values or Obligations? A Reply to O'Neill." Environmental Values 8(1999):107-112. ABSTRACT: Onora O'Neill recently argued that environmental ethics could and should be reformulated in terms of a search for the obligations held by moral agents towards each other, with respect to the non-human world. The more popular alternative, which seeks to establish the intrinsic value of the non-human, is plagued with various theoretical difficulties attaching to the concept of value. It is here argued that O'Neill's attempt to determine fundamental obligations of moral agents on the basis of a non-universalisability criterion does not succeed. It is further claimed that such an approach, in spite of the advantages which O'Neill sees it as having, is itself open to serious objection from the viewpoint of environmental ethics, especially as human beings are able in principle to release each other from mutual obligations. It is concluded that, in spite of the difficulties involved, postulations of (intrinsic) value to non-human nature do seem to be indispensable to environmental ethics. Beauchamp, E. G., "Animals and Soil Sustainability", Journal of Agricultural Ethics 3(1990):89ff. Domestic livestock animals and soils must be considered together as part of an agroecosystem which includes plants. Soil sustainability may be simply defined as the maintenance of soil productivity for future generations. There are both positive and negative aspects concerning the role of animals in soil sustainability. The key component for a fully compatible and acceptable association between domestic animals and soil productivity is proper management. Careful management of the components of an animal-based agroecosystem is required if soil productivity and environmental quality are to be maintained. Beauchamp is in land resource science at the University of Guelph, Ontario.

Beck, Ulrich and Mark A. Ritter translator. Ecological Enlightenment: Essays on the Politics of the Risk

Society. Atlantic Highlands, NJ: Humanities Press, 1994. In the sequel to Risk Society Beck now examines the politics of that risk society. He starts from the assumption that the ecological issue, considered politically and sociologically, is a systematic, legalized violation of fundamental civil rights and, from this position, adduces that the ecological conflict is the successor to the industrial conflict. Beck is at the Ludwig-Maximilians University, Munich. (v7,#1)

Becker, Christian and Reiner Manstetten, "Nature as a You: Novalis' Philosophical Thought and the Modern Ecological Crisis," Environmental Values 13(2004):101-118. This paper aims to introduce the German Romantic poet Novalis into the discussion of the modern ecological crisis. In particular we examine Novalis' unique philosophy of nature as a You in which he deals with both of the two aspects of the relationship between humans and nature: their original identity as well as the distinction between them. We analyse the way in which Novalis understood the relationship between nature and humankind dynamically, and show the significance of his concept of poetry for this question. This concept is analysed and described in respect to its principal features: creativity and love. The former is regarded by Novalis as a general capacity of humans as well as an expression of nature itself. Together with love it forms the base for a possible harmonious relationship between humans and nature. We furthermore interpret Novalis' economic thought against the general background of his philosophy of nature and his understanding of humankind. Novalis recognises the crucial role economic action plays in the relationship between nature and humankind and he offers some important insights into this issue. Finally, we discuss the relevance of Novalis' concept of nature as a You for environmental philosophy. By comparison with other concepts of nature in the modern environmental debate, we show how Novalis' thought offers a new perspective on the human-nature relationship and thus fruitful stimulation for today's environmental philosophy. Becker is in the Interdisciplinary Institute for Environmental Economics, University of Heidelberg. Manstetten is at the Alfred-Weber-Institute, University of Heidelberg. (EV)

It holds the promise of generating resources to meet human needs in the fight against hunger, disease and environmental disasters. However, critics argue that biotechnology will jeopardize evolution and add incalculable, self-made risks to the fragile conditions of life on this planet. (v7,#4)

Beckerman, Wilfred, "'Sustainable Development': Is it a Useful Concept?" Environmental Values 3(1994):191-209. It is argued that 'sustainable development' has been defined in such a way as to be either morally repugnant or logically redundant. 'String sustainability, overriding all other considerations, is morally unacceptable as well as totally impractical and 'weak' sustainability, in which compensation is made for resources consumed, offers nothing beyond traditional economic welfare maximization. Apart from a few small developing countries heavily dependent on minerals or other finite primary products, the measurement of some wider concept of 'sustainable' GNP is a waste of time and such estimates as have been made are virtually worthless. KEYWORDS: Environmental policy, intergenerational justice, measurement of GNP, optimality, social discount rate, sustainability constraints, sustainable development, welfare maximization. Beckerman is at Balliol College, Oxford, U.K. (EV)

Beckerman, Wilfred, Pasek, Joanna, "Plural Values and Environmental Valuation," Environmental Values 6(1997):65-86. ABSTRACT: The paper discusses some of the criticisms of contingent valuation (CV) and allied techniques for estimating the intensity of peoples preferences for the environment. The weakness of orthodox utilitarian assumptions in economics concerning the commensurability of all items entering into peoples choices is discussed. The concept of commensurability is explored as is the problem of rational choice between incommensurate alternatives. While the frequent claim that the environment has some unique moral intrinsic value is unsustainable, its preservation often raises ethical

and other motivations that are not commensurate with the values that people place on ordinary marketable goods. Nevertheless, CV is also claimed to have some advantages and it is concluded that little progress will be made in this area until both sides in the debate recognise what is valid in their opponents arguments. Beckerman, Wilfred. "How Would You Like Your 'Sustainability', Sir? Weak or Strong? A Reply to my Critics." Environmental Values 4(1995):169-179. This article concentrates on the Jacobs and Daly criticisms (Environmental Values, Spring 1994) of my earlier article in the same journal (Autumn 1994) criticising the concept of 'sustainable development.' Daly and Jacobs agreed with my criticisms of 'weak' sustainability, but defended 'strong' sustainability on the grounds that natural and manmade capital were 'complements' in the productive process and that economists are wrong, therefore, in assuming that they are infinitely substitutable. This article maintains that they are confusing different concepts of 'complementarity' and 'substitutability.' It is also argued that, in fact, they do both sell crucial passes in their defence of strong sustainability without providing any clear criteria for their abandonment of it in certain cases. It is also denied that the fact that environmental services may provide different satisfactions from those obtained from other goods and services elevates it to the status of some over-riding moral value, or that discounting future costs and benefits is 'unfair' to future generations. KEYWORDS: discounting, economic welfare, environmental values, inter-generational justice, natural capital, scarce resources, sustainability. Beckerman is at Balliol College, Oxford. (EV)

Beckert, Cristina, ed., Natureza e Ambiente: Representações na Cultura Portuguesa (Nature and Environment: Representations in Portuguese Culture). Lisboa: Centro de Filosofia da Universidade de Lisboa, 2001. Introduction by Viriato Soromenho-Marques. Papers from a symposium held in 1998 at the University of Lisbon. The papers in this anthology show different features of nature and environment in Portuguese culture and were put together in three main groups. The first group regards the way popular Portuguese tradition and contemporary literature conceive the relation between man and nature and how some Portuguese writers and poets predict the environmental crisis we are living now. The second group consists of political and sociological analysis concerning the history of the Portuguese environmental associations and the image of environmental issues released by the media. Finally, the third group concerns nature and environment as philosophical categories and includes papers about the relation between nature and technique, the notion of a "natural community" inherited from Aldo Leopold, along with studies on Kant's aesthetic concept of nature and Portuguese philosophical views on this category. Beckert and Soromenho-Marques are in philosophy at the University of Lisbon. (v.12,#4)

Beder, Sharon, Global Spin: Corporate Assault on Environmentalism. White River Junction, Vermont: Green Books, Chelsea Green Publishing Co., 1997, 1998. Large corporations are using sophisticated techniques to change the way the public and politicians think about the environment and to weaken gains made by environmentalists, turning politicians against increased environmental regulation. Among their techniques: employing PR firms to set up front groups that promote the corporate agenda while posing as public interest groups; creating "astroturf"--artificially created grassroots support groups for corporate causes; strategic lawsuits against public participation (SLAPPS); getting corporate-based environmental educational materials into public schools; and funding conservative think tanks. Beder is a lecturer in science and technology studies, University of Wollongong, Australia.

Beekman, Volkert, "Feeling Food: The Rationality of Perception," Journal of Agricultural and Environmental Ethics 19(2006):301-312. Regulatory bodies tend to treat people's emotional responses towards foods as a nuisance for rational opinion-formation and decision-making. This position is thought to be supported by such evidence as: (1) people showing negative emotional responses to the idea of eating meat products from vaccinated livestock; and (2) people showing positive emotional responses to Magnum's "7 sins" marketing campaign. Such cases are thought to support the idea that regulatory communication about foods should abstract from people's emotional perceptions and that corporate marketing of foods should show restraint in capitalizing upon these weaknesses of the heart. This paper, on the contrary, argues that people's emotional perceptions of foods represent valuable sources of knowledge. This argument is developed by making the dominant reception of people's emotions intelligible by tracing its roots through the history of the Platonic paradigm. Although this paradigm has dominated the philosophical and psychological debate about emotions, the idea that emotions are sources of knowledge has recently gained force. This paper also traces the historical roots of the alternative Aristotelian paradigm. The cases of meat products from vaccinated livestock and Magnum's 7 sins serve to illustrate this controversy. The paper concludes by showing that a neo-Platonic emphasis on the irrationality of emotions does not contribute to a fruitful discussion about implications of people's perceptions for agricultural and food politics, whereas a neo-Aristotelian account of rational emotions could enable regulatory bodies to engage people in a fruitful process of opinion-formation and decision-making about food production and consumption.

Keywords: cognitivism - emotions - food perception - rationality. Beekman is at the Agricultural Economics Research Institute (LEI), The Hague, The Netherlands. (JAEE)

Beekman, Volkert, "Sustainable Development and Future Generations," Journal of Agricultural and Environmental Ethics 17(2004):3-22. This paper argues, mainly on the basis of Rawls's savings principle, Wissenburg's restraint principle, Passmore's chains of love, and De-Shalit's trans-generational communities, for a double interpretation of sustainable development as a principle of intergenerational justice and a future-oriented green ideal. This double interpretation (1) embraces the restraint principle and the argument that no individual can claim an unconditional right to destroy environmental goods as a

baseline that could justify directive strategies for government intervention in non-sustainable lifestyles, and (2) suggests that people's concerns about the deterioration of nature and the environment articulate future-oriented narratives of self-identity that could fuel non-directive strategies to develop further responsibilities towards nearby future generations. Sustainable development, thus, provides sound arguments to restrict people's freedom to follow their own lifestyles, when these lifestyles transgressed the baseline of the restraint principle. However, the individual freedom of choice should not be restricted for any further environmental considerations. Non-directive strategies are thus to stimulate the development of such further responsibilities towards nearby future generations. Keywords: future generations, ideals, justice, sustainable development. Beekman is at the Agricultural Economics Research Institute, The Hague, The Netherlands. (JAEE)

Beekman, Volkert, "Environmental Utilization Space between Science and Politics," Journal of Agricultural and Environmental Ethics 17(2004):293-300. This paper addresses the issue of operationalizing, or quantifying, sustainable development as a practical guideline for day-to-day environmental policy-making. It criticizes attempts at quantifying some environmental utilization space and argues that the uncertainty of scientific knowledge about the unintended environmental repercussions of consumptive choices casts serious doubt about attempts to justify government intervention in non-sustainable lifestyles. Keywords: environment, risks, trust, uncertainty. Beekman is at the Agricultural Economics Research Institute, The Hague, The Netherlands.

Beekman, Volkert, and Frans W. A. Brom, "Ethical Tools to Support Systematic Public Deliberations about the Ethical Aspects of Agricultural Biotechnologies," *Journal of Agricultural and Environmental Ethics* 20(2007):3-12 This special issue of the *Journal of Agricultural and Environmental Ethics* presents so-called ethical tools that are developed to support systematic public deliberations about the ethical aspects of agricultural biotechnologies. This paper firstly clarifies the intended connotations of the term "ethical tools" and argues that such tools can support liberal democracies to cope with the issues that are raised by the application of genetic modification and other modern biotechnologies in agriculture and food production. The paper secondly characterizes the societal discussion on agricultural biotechnology and defends the thesis that normative perspectives fuel this discussion, so one cannot come to grips with this discussion if one neglects these perspectives. The paper thirdly argues that no such thing exists as "one" societal debate in which these issues should be discussed. There are several intertwined debates, and different actors participate in different discourses. Some practical instruments are necessary in order to include the right issues in these debates. These instruments will be coined as "ethical tools," since they are practical instruments that can be used (tools) in order to support debates and deliberative structures for a systematic engagement with ethical issues (hence, ethical tools). Finally, the paper clarifies the ethics of these ethical tools and presents the tools as discussed in the remainder of this special issue: 1) tools to include ethical issues in public consultation and involvement; 2) tools to support systematic reflection upon ethical issues in decision-making; and 3) tools to support explicit communication about values in the food chain. Keywords: Ethical tools - GM evaluation - normative perspective - societal debate - values in the food chain - participatory decision-making - communicative space - value pluralism. Beekman is at Agricultural Economics Research Institute, Wageningen University and Research Centre, The Hague, The Netherlands. Brom is at Ethics Institute, Utrecht University, Utrecht, The Netherlands.

Beeman, Randal. "Friends of the Land and the Rise of Environmentalism, 1940-1954." Journal of Agricultural and Environmental Ethics 8(1995):1-16. The rise of the postwar environmental movement is rooted in the development of ecological consciousness within intellectual circles as well as the general public. Though many commentators cite the 1960s as the focal point of the new environmentalism, the ecological ethic had actually evolved by the 1930s in the writings and speeches of both scientists and public commentators. Agricultural conservationists led the way in broadcasting the message of ecology. Friends of the Land, an agriculturally-oriented conservation organization formed in 1940 and active through the 1950s, is an interesting example of how the agricultural community was an integral

component in the rise of environmentalism. While Friends of the Land flourished only for a brief period, its goals and the ideas that the group represented illustrate how the ecological ethic was burgeoning by the early-1950s. Furthermore, the history of Friends of the Land is an important chapter in the ongoing quest for ecological agriculture and societal permanence. (JAEE)

Beever, Erik. "The Roles of Optimism in Conservation Biology." *Conservation Biology* Vol. 14, no. 3 (2000): 907-9. Although the conservation news can be discouraging, an optimistic outlook will make conservation biologists more effective. An overly skeptical perspective will result in missed opportunities to create new methods of conservation. Beever is in ecology at the University of Nevada, Reno.

Bekoff, Marc, "What is a 'Scale of Life?'," Environmental Values 1(1992):253-256. Mary Midgley's appeal to a scale of life in making decisions about the culling one species of animal rather than another is troublesome and arbitrary. Sociality and intelligence are not reliable indicators of such scale. Bekoff is a biologist at the University of Colorado, Boulder.

Bekoff, Marc, "Jinxed Lynx? Some Very Difficult Questions with Few Simple Answers," Boulder (Colorado) Daily Camera, January 24, 1999. The Division of Wildlife released lynx in the Colorado San Juan Mountains in habitat from which they had become extinct, bringing trapped lynx from Canada for release. There is an expected starvation rate of 50% for the released lynx. Bekoff has serious reservations whether the project is well planned, justified in terms of the animal stress and suffering, and involves too much human dominion over nature, and may be "faking nature." Bekoff is a biologist, University of Colorado, Boulder. The article is on website: <http://www.bouldernews.com/opinion/columnists/mark.html>.

Later update: Four of the thirteen Canada lynxes released in an effort to restore the 18 to 25 pound wildcats to Colorado have starved to death as of mid-April. The Colorado Division of Wildlife's three year, three-quarter million dollar project has been severely criticized from its inception for its lack of scientific rigor and for its failure to respect the individual animals used for restoration purposes. Both animal rights advocates and environmentalists have criticized the project. Reed Noss (former editor of Conservation Biology) has called the project "pathetic" and wrote: "A variety of data and modeling approaches are available to investigate the biological feasibility of reintroducing lynx to Colorado. The state agency chose to ignore the potential of a habitat modeling approach, and instead is rushing in with untested reintroduction of animals. This action suggests that their motivations are political, not biological or ethical. Nevertheless, I hope the project works and that the animals survive and establish a breeding population." University of Colorado biologist, Marc Bekoff objects to the 50% possible mortality rate of the released lynx and to the lack of adequate evaluation of food resources for the animals. He argues that it is irrelevant that these Canadian lynx would likely die anyway at the hands of trappers because "just because animals might be killed one way doesn't justify killing them in other ways." The issue is politically tricky because property rights advocates and ranchers opposed the restoration effort as well. They fear Endangered Species Act restrictions on their uses of property and display a general dislike of

predators. See "4th Lynx Dies In State's Effort At Restoration," NY Times (4/14/99): A20. Contact: bekoffm@spot.Colorado.EDU. Bekoff, Marc, and Ned Hettinger, "Animals, Nature, and Ethics," Journal of Mammalogy 75(no. 1, 1994):219-223. Responds to Howard, Walter E., "Animal Research is Defensible," Journal of Mammalogy 74(no.1, 1993):234-35, arguing that we do not want an ethic that sanctions human treatment of animals as long as it is better than what nature typically has in store for similar animals. (v5,#1)

Bekoff, Marc, and Ned Hettinger, "Animals, Nature, and Ethics," Journal of Mammalogy 75(1994):219-223. A reply to Howard, see above. Howard is unnecessarily combative, lacking in detail, unbalanced, and poorly argued. His vague platitudes do not help in understanding the variety of ethical issues that arise from the diverse uses of animals. For example, nature has no death ethic, nor can nature have one. An ethic that permits any use of animals by humans that causes them less suffering or allows them a longer life than is typical for animals is far too weak. Superficial appeals to nature's brutality to justify the treatment of nonhumans will not do. Bekoff is in biology at the University of Colorado; Hettinger in philosophy at the College of Charleston. (v5,#4)

Bekoff, Marc, "Beastly Passions," New Scientist No. 2236, 29 April 2000, pages 32-35. Besotted whales, ecstatic iguanas and embarrassed chimps have persuaded Marc Bekoff and other biologists that we humans are not alone in our passions. (v.11,#3)

Bekoff, Marc, "Deep Ethology, Animal Rights, and the Great Ape/Animal Project: Resisting Speciesism and Expanding the Community of Equals," Journal of Agricultural and Environmental Ethics 10(1997/1998):269-296. ABSTRACT. In this essay I argue that the evolutionary and comparative study of nonhuman animal (hereafter animal) cognition in a wide range of taxa by cognitive ethologists can readily inform discussions about animal protection and animal rights. However, while it is clear that there is a link between animal cognitive abilities and animal pain and suffering, I agree with Jeremy Bentham who claimed long ago the real question does not deal with whether individuals can think or reason but rather with whether or not individuals can suffer. One of my major goals will be to make the case that the

time has come to expand The Great Ape Project (GAP) to The Great Ape/Animal Project (GA/AP) and to take seriously the moral status and rights of all animals by presupposing that all individuals should be admitted into the Community of Equals. I also argue that individuals count and that it is essential to avoid being speciesist cognitivists; it really doesn't matter whether "dogs ape" or whether "apes dog" when taking into account the worlds of different individual animals. Narrow-minded primatocentrism and speciesism must be resisted in our studies of animal cognition and animal protection and rights. Line-drawing into "lower" and "higher" species is a misleading speciesist practice that should be vigorously resisted because not only is line-drawing bad biology but also because it can have disastrous consequences for how animals are viewed and treated. Speciesist line-drawing also ignores within species individual differences. KEY WORDS: Cognitive ethology, animal cognition, The Great Ape Project (GAP), The Great Ape/Animal Project (GA/AP), Community of Equals, speciesism, moral individualism, animal rights. (JAEE)

Bekoff, Marc, ed., The Smile of a Dolphin: Remarkable Accounts of Animal Emotions. New York: Random House, 2000. With foreword by Stephen Jay Gould. Bekoff, Marc, "Redecorating Nature: Reflections on Science, Holism, Community, Humility, Reconciliation, Spirit, Compassion, and Love," Human Ecology Forum 7(no. 1, 2000):59-67. "Holistic and heart-driven compassionate science needs to replace reductionist and impersonal science. I argue that creative proactive solutions drenched in deep caring, respect, and love for the universe need to be developed to deal with the broad range of problems with which we are confronted. ... My vision is to create a world-wide community in which humans perceive themselves as a part of nature and not apart from her, in which humans who are overwhelmed and whose spirits and souls have been robbed and squelched by living in and amongst steel, concrete, asphalt, noise, and a multitude of invasions of their private space reconnect with raw nature. ... Nature is our unconditional friend and reconnecting with nature can help overcome alienation and loneliness. The power of love must not be underestimated as we forge ahead to reconnect with nature."

Bekoff, Marc, "Consciousness and Self in Animals: Some Reflections," Zygon: Journal of Religion and Science 38(2003):229-245. With reply, Peterson, Gregory R., "Being Conscious of Mark Bekoff: Thinking of Animal Self-Consciousness," Zygon 38(2003):247-256.

Bekoff, Marc, "Minding Animals, Minding Earth: Old Brains, New Bottlenecks," Zygon: Journal of Science and Religion 39(2003):911-941. "I emphasize the importance of broadening behavioral, ecological, and conservation science into a more integrative, interdisciplinary, socially responsible, compassionate, spiritual, and holistic endeavor. I stress the significance of studies of animal behavior, especially ethological research concerned with animal emotions in which individuals are named and recognized for their own personalities, for helping us to learn not only about the nonhuman animal beings with whom we share Earth but also about who we are and our place in nature. We are best understood in relationship with others. To this end I develop the notion of 'minding animals' and 'deep ethology.' Animals are sources of wisdom, a way of knowing." Bekoff is in biology, University of Colorado, Boulder. (v.14, #4)

Bell, Barbara Currier. "Humanity in Nature: Toward a Fresh Approach." Environmental Ethics 3(1981):245-57. Human beings have always been preoccupied with the relationship between humanity and nature, and imaginative literature reflects that preoccupation. The group of views about humanity in nature to be found there is strikingly pluralistic, contrary to the simple "pro" and "con" set to which the environmental debate is often reduced. The richness, however, is not easy to appreciate. In this essay I argue for a new approach to understanding views about the relationship between humanity and nature, one that transcends the conventional terms for such analysis and emphasizes plurality. The approach has ethical dimensions: it aims at strengthening both our hope and our ability to find a better relationship with nature. Bell resides in Southport, CT. (EE)

Bell, Derek. "Environmental Justice and Rawls' Difference Principle." Environmental Ethics 26(2004):287-306. It is widely acknowledged that low-income and minority communities in liberal democratic societies suffer a disproportionate burden of environmental hazards. Is "environmental injustice" a necessary feature of liberal societies or is its prevalence due to the failure of existing liberal democracies to live up to liberal principles of justice? One leading version of liberalism, John Rawls' "justice as fairness," can be "extended" to accommodate the concerns expressed by advocates of environmental justice. Moreover, Rawlsian environmental justice has some significant advantages over existing conceptions of environmental justice. (EE)

Bellesiles, Michael A., Arming America: The Origins of a National Gun Culture New York: Knopf, 2001. Contrary to the gun-toting myth, "gun ownership was exceptional in the seventeenth, eighteenth, and early nineteenth centuries, and guns became a common commodity only with the industrialization of the mid-nineteenth century" and the militarization of American during the Civil War. Prior to that soldiers routinely entered combat with swords, pikes, or even hoes. Pioneers ate meat from the woods, but snared it; guns and bullets were inefficient. clumsy, and expensive. Muskets often exploded, gunpowder could not be used in the rain, and were difficult to aim. Hunting with guns was an upper class activity. The Kentucky marksmen that could outshoot the British are mythology. The Western shoot-ups of the movies are pure fiction. The gun culture was created by gun entrepreneurs, such as Samuel Colt. As is no surprise, Bellesiles has lots of critics. (v.12,#2)

Later: Bellesiles has been accused of such careless scholarship that he was forced to resign as professor of history at Emory University. See Olsen, Florence, "Bellesiles Resigns from Emory after University Report Questions his Research for Book on Guns," Chronicle of Higher Education, Daily News (daily on line edition, not the printed Chronicle), October 28, 2002.

Bello, Walden. "Neither Market Nor State: The Development Debate in South-East Asia", The Ecologist 26(no. 4,1996):167. Fast track capitalism has brought huge growth rates for the newly-industrialized countries of Asia. But the assertion that such rapid growth is due to free trade and free market policies is a myth. The explanation lies in a combination of protection, state intervention and a massive infusion of Japanese capital following the relocation of Japanese companies to South-East Asia in search of cheap labor. As a result, the region's economies are now subordinate to, and dependent on, Japan. (v7,#4)

Nine-year old Samantha Marley, dressed in camouflage and chewing bubble gum, her own shotgun in hand, went hunting for black bear in Vermont woods, winner of a dream hunt, all expenses paid including taxidermy, designed to interest children in hunting. (She took three days out of school.) She has already killed a deer at age seven, also a turkey. But they found no bear.

Belovsky, GE; Botkin, DB; Crowl, TA; Cummins, KW; Franklin, JF; Hunter Jr, ML; Joern, A; Lindenmayer, DB; MacMahon, JA; Margules, CR; Scott, JM, "Ten Suggestions to Strengthen the Science of Ecology", BioScience 54 (no.4, 2004): 345-351(7). There are few well-documented, general ecological principles that can be applied to pressing environmental issues. When they discuss them at all, ecologists often disagree about the relative importance of different aspects of the sciences original and still important issues. It may be that the sum of ecological science is not open to universal statements because of the wide range of organizational, spatial, and temporal phenomena, as well as the sheer number of possible interactions. We believe, however, that the search for general principles has been inadequate to establish the extent to which generalities are possible. We suggest that ecologists may need to reconsider how we view our science. This article lists 10 suggestions for ecology, recognizing the many impediments to finding generalizations in this field, imposed in part by the complexity of the subject and in part by limits to funding for the study of ecology.

"To philosophize about the environment is to reason about nature, and about our various concerns and involvements with the natural world. But this isn't a simple one-way procedure, for we are, of course, a part of nature, not distinct from it, and our concerns are themselves an upshot of natural procedures. Moreover, reason itself is hardly autonomous; it too, is something that has evolved within the natural world, and even if we are still able still to speak, somewhat archaically, of the faculty of reason, we only mistakenly believe that it might operate alone in determining what we think, and what we do. There is no reason to think we can or should be wholly reasonable beings. To philosophize about the environment, then, we need to take the complexity of our own natures fully into account" (p. viii).

"The longest part of the book deals with one of the central questions in environmental philosophy: that of what sorts of things are of direct moral concern. ... I begin with animals, arguing that they matter at least in so far as they are sentient. ... As far as non-sentient life forms are concerned, the claim is that even if we agree, as well we might, that such things have a good of their own, are able to be benefited or harmed, and can flourish or decline, still none of this gives us reason to promote their well-being or further their ends" (pp xi-xii). Bendik Keymer, Jeremy, *The Ecological Life: Discovering Citizenship and a Sense of Humanity*. Lanham, MD: Roman and Littlefield, 2006. A humanistic perspective on environmental philosophy that challenges some dogmas of deep ecology and radical environmentalism while speaking for their best desires. Written as a series of lectures, the book argues that being human-centered leaves us open to ecological identifications, rather than the opposite. Draws on analytic and continental traditions, as well as literature and visual media. Environmental philosophy needs a sense of ecological justice consonant with human rights. Bendik-Keymer is in philosophy, Dept of International Studies, American University of Sharjah, United Arab Emirates.

Bendik-Keymer, Jeremy, "Analogical Extension and Analogical Implication in Environmental Moral Philosophy," Philosophy in the Contemporary World 8 (Number 2, Fall-Winter 2001):149-158. Two common claims in environmental moral philosophy are that nature is worthy of respect and that we respect ourselves in respecting nature. In this paper, I articulate two modes of practical reasoning that help make sense of these claims. The first is analogical extension, which understands the respect due human life as the source of a like respect for nature. The second is analogical implication, which involves nature in human life to show us what we are like. These forms of reasoning are relevant to environmental virtue ethics in that both help us conceptualize how respect for nature can be part of our sense of humanity, and not opposed to our sense of humanity. Bengston, David N. and Xu, Zhi., Changing National Forest Values: A Content Analysis. USDA Forest Service General Technical Report NC-323, 1995. 29 pages. The authors identify four ways in which people value forests and forest ecosystems: (1) economic/utilitarian, (2) life support, (3) aesthetic, and (4) moral/spiritual. These values are either instrumental, where the good is equated with some desirable human end, or non-instrumental, the worth of something seen as an end in itself. It is important to separate values from objects-of-value. "Objects of value are the things that we care about or think are

important, values are the ways in which we care about those things. Values are a conception of what is good about objects of value. Confusion between values and objects of value is common because the dividing line between these two concepts is subjective and dependent on how the terms are defined" (p. 6). Report produced at the U.S. Dept. of Agriculture, Forest Service, North Central Forest Experiment Station, 1992 Folwell Ave., St. Paul, MN 55108. (v.9,#4)

Bengston, David N., "Changing Forest Values and Ecosystem Management," Society and Natural Resources 7(1994):515-533. We are currently in a period of rapid and significant change in forest values. Forest managers must address the questions: (1) What is the nature of forest values? Can all forest values be reduced to a single dimension, as assumed in utilitarian- based traditional forestry and economics, or are these values multidimensional and incommensurate? (2) What specific values are involved? (3) What is the structure of these values? How are they related to each other in value systems? (4) How and why have forest values changed over time? (5) What do changing forest values imply for ecosystem management? Bengston is with the USDA Forest Service, North Central Forest Experiment Station, St. Paul, MN. (v.10,#1)

Bengston, David N., Trevor J. Webb and David P. Fan, "Shifting Forest Value Orientations in the United States, 1980-2001: A Computer Content Analysis," Environmental Values 13(2004):373-392. This paper examines three forest value orientations - clusters of interrelated values and basic beliefs about forests - that emerged from an analysis of the public discourse about forest planning, management, and policy in the United States. The value orientations include anthropocentric, biocentric, and moral/spiritual/aesthetic orientations toward forests. Computer coded content analysis was used to identify shifts in the relative importance of these value orientations over the period 1980 through 2001. The share of expressions of anthropocentric forest value orientations declined over this period, while the share of biocentric value expressions increased. Moral/spiritual/aesthetic value expressions remained constant over time. The observed shifts in forest value orientations have implications for identifying appropriate goals for public forest management and policy, developing socially acceptable means for accomplishing those goals, and dealing with inevitable conflict over forest management. Bengston is at the North Central Research Station, USDA Forest Service, St. Paul, MN. Webb is with the Social Sciences Program, Bureau of Rural Studies, Agriculture, Fisheries, Forestry--Australia, in Canberra. (EV)

Bengston, David N. and Fan, David P. I. "The Public Debate about Roads on the National Forests: An Analysis of the News Media, 1994-98." Alternatives 25(No.3, Summer 1999):4- . The debate about forest roads as expressed in news stories reflects the changing social context in which the Forest Service must overhaul its policy. Some of the conflicting views are predictable, but the debate among recreational users is surprising. (v10,#4)

Bennett, David H., "Triage as a Species Preservation Strategy," Environmental Ethics 8(1986):47-58. The use of selective preservation for species is seen as basically unethical. Either it selects appropriate

species on the basis of human instrumental use, or it makes the logical/ethical flaw of treating collectives as individuals. If triage is ethical, it is so only as applied to individuals. (Katz, Bibl # 1)

Bennett, David H. "Triage as a Species Preservation Strategy." Environmental Ethics 8(1986):47-58. In this paper I discuss what triage is and how it might be applied to the preservation of endangered species. I compare the suggested application of triage to endangered species with its application to wartime military practice, distribution of food aid, and human population control to show that the situation of endangered species is not analogous to these other suggested uses. I argue that, as far as species preservation is concerned, triage starts with the wrong norms and values: it is "human chauvinistic," giving primacy to economic, political, and sociocultural aspects that emphasize human interests without recognizing the connection between the survival of other species and the survival of humans. Benson, John, "Aesthetic and Other Values in the Rural Landscape," *Environmental Values* 17(2008):221-238. The paper discusses some relationships between aesthetic and non-aesthetic reasons for valuing rural landscape, i.e., landscape shaped by predominantly non-aesthetic purposes. The first part is about the relationship between aesthetic reasons and considerations of utility and argues for an intimate connection between them. The next part considers the relationship between aesthetic and other non-instrumental reasons for valuing landscape and argues that there are important contingent but no essential connections between them. The third part considers the strength or weakness of aesthetic reasons for resisting landscape changes that would result from changes in land use.

Benson, Reed D. "A Watershed Issue: the Role of Streamflow Protection in Northwest River Basin Management." Environmental Law 26, no.1 (1996): 175. Benson examines how watershed protection efforts have become popular in the Northwest, as governments at all levels have found reasons to embrace them. He concludes that although these efforts promise a holistic approach to environmental problems, Western water law and politics may prevent them from addressing a key need of healthy watersheds: adequate instream flows. (v7, #3)

Bensted-Smith, Robert, "Repelling Invaders and Other Challenges for the Charles Darwin Foundation and the Galapagos National Park Service," Society for Conservation Biology Newsletter 9 (no. 4, 2002):1, 3. As of May 2002, after intensive efforts, including GPS technology, feral pigs have been finally and completely removed from Santiago, the largest island in the world from which pigs have been eradicated.

The pigs have wreaked havoc on Santiago since the mid 1800's. Now the biggest challenge to conservation in the Galapagos is exotic insects and plants. There are over 600 introduced species of plants, and these outnumber native species. (v.13,#4)

Benton, L. M. "Selling the Natural or Selling Out? Exploring Environmental Merchandising." Environmental Ethics 17(1995):3-22. In the twenty years since the first Earth Day, the environmental movement has become increasingly "commercialized." I examine why many environmental organizations now offer an array of products through catalogs and magazines, or manage stores and outlets. In part one, I explore some of the economic and political influences during the 1970s and 1980s that resulted in increased organizational sophistication and an increased production of environmental products. The part two, I explore the "commercialization" of environmentalism from two angles. First, in terms of a deconstructionist critique of the system of commodities and image, I demonstrate that when environmental organizations partake in this consumer culture, they actually reproduce precisely the values and institutions that they criticize. Second, from a "constructionist" perspective, I argue that environmental products can re-enchant or reconnect people with nature, and thus can help change cultural attitudes about human-nature relationships. I conclude that environmental products are contradictory because environmental merchandise is juxtaposed uneasily between environmental ideological rhetoric and material ambition. Environmental organizations must recognize this ambiguity before they can deal with the problem effectively. Benton is in geography at Syracuse University. (EE)

Benton, Ted, ed. The Greening of Marxism. New York: Guilford Publications, Inc., 1996. 310 pp. \$42.95 cloth, \$17.95 paper. Tracing the history of the integration of ecological understanding with Marxist philosophy, this book explores the influence of green politics on Marxism, examines the new politics emerging from these movements, and shows how red-green alliances can transform the political landscape. Benton, Ted, "Why Are Sociologists Naturephobes?" Pages 133-145 in José López and Gary Potter, eds., After Postmodernism: An Introduction to Critical Realism, London: Athlone Press, 2001. Sociology has been responsible for fostering an anti-nature attitude which has significant implications for ecology and environmental ethics.

Benton, Ted, Natural Relations: Ecology, Animal Rights and Social Justice. New York: Routledge, 1993. 250 pages. \$ 17.95 paper. Debates about the moral status of animals are used to critique human rights discourse. Both humans and other species of animals are vulnerable to harm and require the same conditions for their well being, and the author develops a naturalistic, but anti-reductionist view of human nature. In a post-capitalist society, we need an ecological and socialist view of human rights. Benton is Reader in sociology at the University of Essex. (v5,#1) Reviewed by Eckersley, Robyn, "Natural Justice: From Abstract Rights to Contextualised Needs." Environmental Values 3(1994):161-172. (EV)

Benton, Ted., "Environmental Values and Human Purposes," *Environmental Values* 17(2008):201-220. Some writings by Alan Holland provide the starting point for an exploration of sources of environmental value in human social practices. It is argued that many practices both serve human purposes and also provide a setting for the emergence of environmental value. Such practices are ones in which activity is embedded in, and so both strongly constrained and enabled by, its conditions and media. Capitalist 'modernisation' has tended to erode these practices and associated values in favour of external purposes

and instrumental values, especially in the farmed countryside. In the face of this, and partly on grounds of social justice, a re-valuation of urban open spaces is advocated.

Benton, Ted. "Why Are Sociologists Nature-phobes?" *After Postmodernism: An Introduction to Critical Theory*, Jose Lopewz and Gary Potter, eds. London: Athlone, 2001: 133-45.

Benzoni, Francisco, "Rolston's Theological Ethic," Environmental Ethics 18(1996):339-352. The centerpiece of Holmes Rolston, III's environmental ethic is his objective value theory. It is ultimately grounded not in the Cartesian duality between subject and object, but in the divine. It is not his value theory, but rather his anthropology that is the weak link in an ethic in which he attempts to weave together the natural, human, and divine spheres. With a richer, more fully developed theological anthropology, Rolston could more deeply penetrate and critique those aspects of the present ways of being-in-the-world that are environmentally destructive. Benzoni is a doctoral student at the University of Chicago. (EE)

Benzoni, Francisco. "Creatures as Creative: Callicott and Whitehead on Creaturely Value." Environmental Ethics 28(2006):37-56. Alfred North Whitehead's metaphysics provides a means for overcoming the dualism embedded in J. Baird Callicott's "postmodern" axiology. Indeed, the lessons Callicott draws from the new physics and ecology imply Whitehead's position. While Callicott holds that subjectivity and valuing require consciousness, Whitehead argues that subjectivity and valuing characterize all metaphysically basic entities, conscious and non-conscious. Removing the constraint that valuing requires consciousness is a slight shift, but it makes all the difference. By jettisoning this constraint, we can develop a robust account of intrinsic value that overcomes Callicott's duality, while retaining his insights that valuing requires a valuer and fluent energy is more fundamental than discrete entities. Berger, Anthony R. "Rapid Landscape Changes, Their Causes, and How They Affect Human History and Culture." *The Northern Review* Number 28 (Winter 2008): 15-26. Many landscape changes can readily be seen within a human lifetime, and rapid changes have often occurred: volcanic eruptions, coastal erosion, climate change, floods, fires, earthquakes. Paleo-environmental science has revealed prior rapid landscape changes, sometimes in the memories of indigenous peoples. How people reacted to such changes might influence the way we think today, providing perspectives helping to cope with environmental change in the coming years. Berger is in environment and development at Sir Wilfred Grenfell College, Memorial University of Newfoundland and Labrador. This paper is published in a special collection of proceedings from the conference "Rapid Landscape Change and Human Response in

the Arctic and Subarctic," Whitehorse, Yukon (2005).

Berger, Antony R., Dark Nature in Classic Chinese Thought. Victoria, BC: Centre for Studies in Religion and Society, University of Victoria, 1999. 78 pages. ISBN 1-55058-205-4. Contact: CSRS, University of Victoria, Box 1700 Stn CSC, Victoria BC V8W 2Y2, Canada. E-mail: csrs@uvic.ca. How the founders of Daoism (Taoism) and Confucianism experienced and acknowledged natural catastrophes, river floods, channel switching, earthquakes, landslides, and sea-level rise. Many natural processes cause harm to humans and to ecosystems. Nature has two sides: nature supports life, but natural forces are not always benevolent to the well-being of either humans or ecosystems. This darker side of nature has been overlooked by environmental philosophers.

Some Chinese thinkers took the anthropocentric view that bad things in nature were the consequences of bad human actions. They saw the world as fundamentally harmonious, as long as people followed the correct rituals and codes of behavior (rather like some modern environmentalists). Other Chinese thinkers held that harm was part of nature's processes and is to be accepted as part of that pattern. On a human scale, these may cause pain and sorrow; on a cosmic scale, they are only the flow of the Dao (Tao). "There is a challenge, which in my view has not yet been fully met, to develop a way of living and thinking, naturalistic or not, that recognizes fully that nature has for all life forms both a benevolent and a harmful dimension" (p. 46). Berger is an earth scientist. (v.11,#1)

Berger, Joel and Carol Cunningham, "Active Intervention and Conservation: Africa's Pachyderm Problem," Science 263(1994):1241-1242. Few conservation programs have succeeded where the animal has valuable body parts that can be poached. The ban on elephant ivory may be working, though causing dissension in Africa, where countries with abundant elephants want to sell legal ivory, to support conservation. Africa's most endangered pachyderms are the rhinoceroses, in 25 years reduced from 65,000 to 2,500, a loss of 97%. Only one unfenced population of over more than 100 animals exists, in Namibia. Namibia, Zimbabwe, and Swaziland are using a controversial dehorning, where the horn is sawed off and the animal returned to the wild. Does the dehorning deter poachers? Can hornless mothers defend calves from predators? Berger and Cunningham think that the answer may be no, on balance, in both cases, but both questions are hard to answer, partly because horned and dehorned animals mix; there is evidence on both sides.

Predators may not turn to rhinoceros calves until there is extended drought and other prey are in shorter supply. It might be better to move the rhinos to fenced areas. On the science and advocacy issue, Berger and Cunningham, a husband and wife team, had returned to Namibia when this article was published and a month later found that their research permits were not renewed by U. S. agencies and their money frozen by the Namibian government, apparently because their research yielded results that cast doubts on the wisdom of an established official policy. Their research has been supported by what looks like a Who's Who in government and NGO conservation agencies. See editorial by Peter F. Brussard in Society for Conservation Biology Newsletter, vol. 1, issue 2, May 1994. (v5,#2)

Berghoefer, Uta, Ricardo Rozzi, and Kurt Jax. "Local versus Global Knowledge: Diverse Perspectives on Nature in the Cape Horn Biosphere Reserve." *Environmental Ethics* 30(2008):273-294. A case study of socio-ecological research conducted in Puerto Williams, Chile reveals that persons belonging to different sociocultural groups in Cape Horn have a diversity of perspectives and relationships with nature. For example, a strong sense of home and belonging was expressed by the indigenous Yahgan community and by old residents, mostly descendents of early twentieth-century colonizers. However, people identified with resource use did not include positive answers for a sense of home. The concept of common land presented marked contrasts among respondents. Those identified with a cultivating type of relationship favored private property over public land. For respondents identified with an embedded type of relationship, freedom of movement was one of their most essential values. Some respondents identified with resource use and those identified with intellectual and aesthetic relationships with nature also valued common land. The approach used in this study transforms polarized and dichotomous notions into gradients of perspectives related to different degrees of local and global ecological and cultural environments. The resulting hybrid vision of perspectives on nature may be helpful in times of global change, where both local and global scales contribute to identify specific problematic asymmetries as well as opportunities for communication among different sociocultural groups. Berkes, Fikret, "Religious Traditions and Biodiversity," *Encyclopedia of Biodiversity* 5: 109-120. Religious traditions have little to say specifically about biodiversity, but they provide the values, worldviews, or environmental ethics that shape the way in which different societies interact with biological diversity and nature in general. In this sense, religion can be part of the problem or part of the solution. Anthropologist Eugene Anderson observes that all traditional societies that have succeeded in keeping resources productive over time have done so in part through religious or ritual representation of resource management. The key point, he says, is not religion per se, but using emotionally powerful

cultural symbols to maintain a sense of sacred respect. (v.11,#4)

Bermond, Bob, "Consciousness or the Art of Foul Play," Journal of Agricultural and Environmental Ethics 10(1997/1998):227-247. ABSTRACT. The psychological literature about consciousness has been analyzed. It is argued that:

- 1) Only the higher symbolic cognitive powers like the ability to keep secrets, knowledge of self or self-consciousness, a long-term view on the future, the ability to determine long-term goals, and to freely plan future behavior, add positive fitness-value to consciousness. Without these higher intellectual abilities consciousness will have only negative fitness value and no positive one. The intellectual powers mentioned may therefore be considered as prerequisites for consciousness. Consciousness may therefore only be expected in those animal species that show these capacities in their behavior. So far these capacities have only been described for the anthropoid apes and humans. For the time being, they are therefore the only species in which consciousness may be expected.
- 2) Consciousness is not synchronous with real time. Human consciousness is, in as well in the perception of stimuli as in the experience of free will to act, most times running after the facts.
- 3) Consciousness has to be viewed as an instinct that has been developed late in evolution. It is partially based upon primarily innate neural circuits, fulfilling specialized cognitive functions by which information is interpreted and inferences are made, in a more or less automatic way.

4) Most information processing concerning daily decisions, is done by parallel nonconsciously functioning neural modules using 'sloppy logic', and only the end-product of these modules can be pushed forwards to consciousness. For this reason consciousness will, most times, lack the necessary information to come to the correct inferences about the evaluations on which the decision is based. Therefore, only rarely will people have insight into their cognitive processes or the real sources of their behavior. When asked why they behaved as they did, they will produce confabulations. However, people's erroneous reports are not capricious, but regular and systematic in such a way that they will fit the pre-existing ideas and beliefs. The contents of these reports are therefore not based upon introspection, but, most times, on (sub)culturally accepted ideas.

KEY WORDS: Consciousness, fitness-value and foul play. (JAEE)

Bernhardt, E.S. et al (15 others), "Synthesizing U.S. River Restoration Efforts," Science 308(29 April 2005):636-637. There is increasing evidence that the degradation of waters is at an all-time high (despite the Clean Water Acts). More than one-third of the rivers in the United States are impaired or polluted, and freshwater withdrawals in some regions are so extreme that some major rivers no longer flow to the sea year round. Extinction rates for water fauna are five times that for terrestrial fauna. But stream and river recovery can work, though it tends to be fragmented and disorganized. It can also be a highly profitable business. The lead author is in natural resources and environment, University of Maryland.

Berry, Gregory R., "Organizing Against Multinational Corporate Power in Cancer Alley: The Activist Community as Primary Stakeholder", Organization and Environment, 16, (No. 1, 2003): 3-33. An examination of how a small, oppressed and seemingly powerless community in Louisiana persevered to defeat the strategic plans of a multinational chemical company that was supported by local and state government elites. The evolving construct of environmental justice played a significant part of this battle as community groups formed coalitions with local, state, and national agents and organizations to challenge the decision to site a hazardous facility. Lawsuits resulted in costs, lengthy delays, and uncertainty for the corporation, leading Shintech to abandon its original site of choice. Implications of the study are discussed for stakeholder theory, environmental justice scholars and community advocacy groups. Gregory is based at Texas Wesleyan University where he works on organizational theory, specialising in the social, political and economic interactions of firms and communities.

Berry, R. J., "Environmental Ethics--From Eden to Rio--and Back Again?" Faith and Thought, April 1998, No. 23. Faith and Thought is published by The Victoria Institute, Croydon, Surrey, UK. ISSN 0955-2790. A prominent British ecologist, geneticist, and conservative Christian reflects on the Biblical concept of nature and humans in nature (Eden), contemporary movements in environmental conservation, surrounding and resulting from Rio, and wonders whether we are not returning to a concept of humans as trustees of creation (aka managers in secular circles). Christians should be making up their minds about environmental issues and sharing them with others, taking the lead and witnessing to the glories in God's creation. Photographs of Earth seen from space have become icons, awakening people to the environment and its fragility. We are living in a finite, not infinite, world and this is all we have. (v.9,#3)

Berry, R. J. "Sam", "Is a Global Environmental Ethic Attainable?" Science and Spirit 7 (no. 4, Winter 1996):6-7. Berry, a geneticist at University College, London, served on a committee to write a Code of Environmental Practice for the Economic Summit of Nations, a secular group, as well as on a Church of England group to prepare a statement of environmental stewardship. He found that the principles of both groups were almost the same. He also serves with an IUCN group, the Ethics Working Group, and finds their principles similar. This leads him to think that a world ethic for sustainable living may be possible. (v7,#4)

Berry, R. J. ("Sam"), God's Book of Works: The Nature and Theology of Nature. London: T&T Clark. New York: Continuum, 2003. Gifford Lectures at the University of Glasgow, 1997-1998. Representative chapters: Design and Deity, Theology of DNA, Green Religion, Green Science, Running out of World, Governments and Greens, Convergence and Stewardship, Awe and Wonders, Science and the Cross.

"The underlying theme of everything in this book is the relation of God to his creation. In examining this relationship, I have had to assume the existence of God. If he does not exist, this obviously rules out any interaction and condemns my enterprise; natural theology (and the theology of nature) will be no more than a misleading vapour.

My approach has been to explore the credibility and anticipated results (or the coherence) of the relationship in as rigorous a way as possible, and thence face the decision whether this leaves us with any firm results on which to ground a natural theology, never mind an understanding of God himself. In adopting this approach, I am following the methodology of natural science rather than theology. I am setting out to test a hypothesis" (p. 234)

"Stewardship is a rational conclusion from a study of the natural world and its misuse; when awe is added to stewardship it provides a motive for action as well as an occasion for enjoyment. Awe can be regarded as an empowerment of stewardship. ... If we couple awe to stewardship, we have a powerful engine for creation care."

Berry is professor of genetics (emeritus) at University College, London, and a past president of the British Ecological Society.

Berry, R. J., "Sam", "Creation and the Environment," Science and Christian Belief 7 (1995): 21-43. Debates about creation and evolution have distracted attention from the proper understanding of the environment as God's creation, for which we are responsible to God. This has left the way open for a plethora of odd religious ideas, which in turn have raised suspicions about orthodox Christian interpretations of the environment and distracted from the obligations of stewardship laid by God on his people. This essay reviews some of the deficiencies and divergences of creation doctrine, beginning from the implicit teaching of scripture that God created the world ex nihilo, that nature is not divine, and that it has been redeemed by Christ's work. The consequence of living in God's image in God's world is that we are stewards, accountable to God for our creation-care. The working-out of this doctrine is explored in terms of the more important distortions of our relationship to the world (syncretism, New Age teachings, Gaia, creation spirituality, deep ecology) and the weakness of our current perceptions. The conclusion is that traditional teachings about responsible stewardship need to be asserted and emphasized by Christians,

and that these form the basis of environmental care for Christian and non-believer alike. Berry is professor of genetics at University College London, formerly president of the British Ecological Society, of the Linnean Society, and the European Ecological Federation. (v6,#2)

The title reflects Berry's feelings about how long he has been arguing his case against expansionist capitalism's social and environmental effects, now some 30 years, and how idiosyncratic his case appears to some. Essays on economics, medicine, the meaning of family, agriculture, forestry, education, and the state of American democracy. Small communities and the places they occupy are threatened by the construction of a global economy. Because such an economy makes it possible for the products of any region to be undersold by the product of another region, it makes the moderate, stewardly use of arable land unlikely. Private people, farm families, cannot afford to work this way. As a result, growing food, managing fuel and manufacturing all will be done by large corporations. And these, Berry says, are not interested in the good health--economic or natural or human--of any place on earth. Berry teaches English at the University of Kentucky and is also a farmer there. Bertholdbond (Berthold-Bond), Daniel. "The Ethics of `Place': Reflections on Bioregionalism." Environmental Ethics 22(2000):5-24. The idea of "place" has become a topic of growing interest in environmental ethics literature. I explore a variety of issues surrounding the conceptualization of "place" in bioregional theory. I show that there is a necessary vagueness in bioregional definitions of region or place because these concepts elude any purely objective, geographically literal categorization. I argue that this elusiveness is in fact a great merit because it calls attention to a more essential "subjective" and experiential geography of place. I use a reading of Aldo Leopold's Sand County Almanac as an example of the value of a non-literalistic geography for the understanding of place. (EE)

The screen continues to be the primary generator of visual imagery in contemporary culture, including of the natural world. This paper examines the screen as visual interface in the construction and consumption of physical environments. Screens are increasingly incorporated in our daily habits and imbricated into our lives, especially as mediating technologies are embedded into the surfaces of our physical surroundings, shaping and molding our interactions with and perceptions of those environments.

As screens become increasingly portable and digitized, they further modify our relationships with environments, projecting multiple images and imagery which fracture and layer visual consumption. And as screens become ubiquitous in urban environments, they network into maps of information control and consumption. We need to fully understand these processes of screen-mediated representation and interaction in order to be able to comment on the ethics of contemporary practices of visually consuming physical environments. Betty, L. Stafford, "Making Sense of Animal Pain: An Environmental Theodicy," Faith and Philosophy 9 (no. 1, January, 1992):65-82. No present theodicy, including John Hick's, makes adequate sense of animal pain. Hick fails when he enlists animal pain exclusively in the service of human soul growth. Frederick Ferré correctly points out that this solution is too anthropocentric. A more adequate theodicy avoids this mistake by showing that pain, from amoebas to humans, is crucial not only to the betterment of souls but to their very origination, a process beginning long before humans evolved on the planet. Creation is the process by which God is multiplying God's own experience, and this process necessarily requires eons of time, necessarily starts with the lowest forms of life, and necessarily entails pain and

suffering. The resulting good justifies all the howls and lamentation of the planet from its inception. Betty is at California State University, Bakersfield. (v3,#2)

Bhattacharjee, Yudhijit. "A Sluggish Response to Humanity's Biggest Mass Poisoning." *Science* Vol. 315, no. 5819 (23 March 2007): 1659-61. In India, in the region of Chandalathi, a series of wells were drilled to provide water, since the surface water had become increasingly polluted and in short supply. However, the well water proved to have high levels of naturally occurring arsenic, and more than 40 million people live in areas where such drilled wells have elevated levels of arsenic. In neighboring

Bangladesh, over 82 million people are potentially affected. Drinking well water results in disease and death. The Indian government's response has been slow and uncertain. Filters are an option, but filters are not well maintained. Drilling deeper wells produces clean water, but is expensive. Cleaning up the surface water is another option, and also is expensive. When such arsenic-laden aquifer water reaches the surface in springs and is exposed to air for a few days, the metal binds to iron oxides and other compounds and precipitates out of the water, but this does not happen in an enclosed tube well.

Biao, Xie, Xiaorong, Wang, Zhuhong, Ding, and Yaping, Yang, "Critical impact assessment of organic agriculture," Journal of Agricultural and Environmental Ethics 16(2003):297-311. Organic agriculture has set for itself the goals of minimizing all forms of pollution and maintaining sustainability of the farming system. By striving for these goals, organic farming meets the demands of an increasing number of consumers who are critical of conventional production methods. This paper gives an overview of the present state of the art in the different issues. Organic farming is suited to improve soil fertility and nutrient management markedly on the farm level; regarding biodiversity, comparison studies show that organic farming has more positive effects on biodiversity conservation. KEY WORDS: biodiversity, environmentally friendly production, nutrient management, organic agriculture, product quality, soil fertility. (JAEE)

Binder, Renee and Burnett, G. W., "Ngugi Wa Thiong'o and the Search for a Populist Landscape Aesthetic." Environmental Values 3(1994):47-59. This essay examines how Ngugi wa Thiong'o, east Africa's most prominent writer, treats the landscape as a fundamental social phenomenon in two of his

most important novels, A Grain of Wheat and Petals of Blood. Basing his ideas in an ecological theory of landscape aesthetics resembling one recently developed in America, Ngugi understands that ability to control and manipulate a landscape defines a society. Nostalgia for the landscape lost to colonialism and to the corrupting and alienating influences of international capitalism needs to be replaced by its progressive evaluation as it is reshaped by collective action for a new future. Alienation from, and loss of responsibility for, the land may be a major factor contributing to Africa's environmental problems. Ngugi's position casts doubt on professional land management's ultimate ability to influence the shape of the landscape in the face of the collective social will. KEYWORDS: Ngugi wa Thiong'o, landscape aesthetics, development, Kenya. Binder is at Sumter National Forest, S.C. Burnett is with the Dept. of Parks, Recreation and Tourism Management, Clemson University, S.C. (EV)

Binimelis, Rosa, "Coexistence of Plants and Coexistence of Farmers: Is an Individual Choice Possible?" *Journal of Agricultural and Environmental Ethics* 21(2008):437-457. The introduction of genetically modified organisms (GMOs) in Europe has been characterized by controversy. In 2002, the European Union introduced the concept of "coexistence" as a compromise solution that, through the establishment of science-based technical measures, should allow the market to operate freely while reducing policy conflicts on GMOs. However, the concept remains highly contested and the technical measures difficult to apply. This paper presents qualitative research on the conceptualization and implementation of the coexistence framework in two regions of Spain (Catalonia and Aragon), where 42% and 55% of maize was GM in 2006, respectively. In this context, the concept of coexistence and its proposed implementation both fail to resolve previous conflicts and actually work to generate new ones through the individualization of choice and impacts. Considerations of the social conditions in which the technology and the management measures are implemented were not taken into account. This resulted in the promotion of biotechnological agriculture over other alternatives.

Binimelis is at the Institute of Environmental Science and Technology (ICTA), Autonomous University of Barcelona, Spain.

Birch, Charles. *Science and Soul*. West Conshohocken, PA: Templeton Foundation Press, 2008. Birch, a famous Australian ecologist, reminiscences about persons influential in his career many famous ecologists, evolutionary biologists, and philosophers of religion and develops his philosophy of life that he calls process pansubjectivism, panentheism. "Process thought does not see any line in the sand where mentality begins. Hence, there is no zero-mentality at any level of the evolutionary sequence of actual entities" (p. 165). In the course of this he addresses environmental ethics and values in nature.

Birch, Thomas H. "Moral Considerability and Universal Consideration." Environmental Ethics 15(1993):313-32. One of the central, abiding, and unresolved questions in environmental ethics has focused on the criterion for moral considerability or practical respect. In this essay, I call that question itself into question and argue that the search for this criterion should be abandoned because (1) it presupposes the ethical legitimacy of the Western project of planetary domination, (2) the philosophical methods that are and should be used to address the question properly involve giving consideration in a root sense to everything, (3) the history of the question suggests that it must be kept open, and (4) our deontic experience, the original source of ethical obligations, requires approaching all others, of all sorts, with a mindfulness that is clean of any a priori criterion of respect and positive value. The good work that has been done on the question should be reconceived as having established rules for the normal, daily consideration of various kinds of others. Giving consideration in the root sense should be separated from giving high regard or positive value to what is considered. Overall, in this essay I argue that universal consideration--giving attention to others of all sorts, with the goal of ascertaining what, if any, direct ethical obligations arise from relating with them--should be adopted as one of the central constitutive principles of practical reasonableness. Birch is in the Department of philosophy, University of Montana, Missoula, MT. (EE)

Birch, Thomas H. "The Incarceration of Wildness: Wilderness Areas as Prisons." Environmental Ethics 12(1990):3-26. Even with the very best intentions, Western culture's approach to wilderness and wildness, the otherness of nature, tends to be one of imperialistic domination and appropriation. Nevertheless, in spite of Western culture's attempt to gain total control over nature by imprisoning wildness in wilderness areas, which are meant to be merely controlled "simulations" of wildness, a real wildness, a real otherness, can still be found in wilderness reserves. This wildness can serve as the literal ground for the subversion of the imperium, and consequently as the basis for the practical establishment of and residence in what Wendell Berry has called the "landscape of harmony." Here all land becomes wild sacred space that humans consciously come to reinhabit. In this subversive potential lies the most fundamental justification for the legal establishment of wilderness reserves. Birch is in the Department of philosophy, University of Montana, Missoula, MT. (EE)

Birch, Thomas H. Review of The Natural Alien. By Neil Evernden. Environmental Ethics 12(1990):283-87.

Birch, Thomas H., "The Incarceration of Wildness: Wilderness Areas as Prisons," Environmental Ethics 12(1990):3-26. This important paper may signal a new research direction in environmental ethics. Birch presents a literary/philosophical/political analysis of the other, of "wildness," and of the social deception in Western culture about wilderness and environmentalism. The creation of wilderness preserves is a continuation of domination, unless it is understood as the maintenance of the experience of wild otherness. Wherever the wild occurs, it is a pocket of resistance to the imperial domination of anthropocentric Western culture. Because this paper represents a revolt against analytic argumentation as the method of environmental ethics, it tends to be vague; e.g., the practical conclusion---preserve wilderness anyway---seems to contradict the theme. But this is a provocative speculation into the nature of wilderness and environmental policy. (Katz, Bibl # 2)

Bird, Elizabeth Ann R., "The Social Construction of Nature: Theoretical Approaches to the History of Environmental Problems." Environmental Review 11 (1987): 255-264. Important and provocative argument concerning the social construction of ecological laws which describe nature. Ecology does not provide us with an accurate representation of nature, but rather a socially constructed experience based on negotiations among the scientific community. This view has enormous implications for environmental ethics: it questions the idea that a "natural world" can be preserved. (Katz, Bibl # 2)

Birkeland, Charles, "Ratcheting Down the Coral Reefs", BioScience 54(no.11, November 2004):1021-1027(7). Coral reefs are continuing to deteriorate around the world, despite millions of dollars worth of government effort per year, the commitment of more than 450 nongovernmental organizations, and a long list of successful accomplishments. Researchers and managers must become more aware of positive feedback, including the self-reinforcing ecological, technological, economic, cultural and conceptual processes that accelerate the degradation of coral reefs. Much of the research on coral reef damage has focused on its proximal causes (e. g., global warming, increased atmospheric carbon dioxide, overfishing, pollution, sedimentation, and disease) rather than its ultimate causes, the increasing human population and

associated economic demands. To stop the deterioration of coral reef ecosystems, management must be proactive, terminating the self-reinforcing processes of coral reef degradation rather than perpetually restoring reefs or resource stocks. This can be accomplished only by clarifying the entire economic picture to instill more responsible behavior in the public.

Birkeland, Janis, "Beyond Economic Man: A Commentary," Environmental Ethics 18(1996):335-336. The book by Marianne A. Feber and Julie A. Nelson, Beyond Economic Man: Feminist Theory and Economics (Chicago: University of Chicago Press, 1993) is a preliminary attempt to address the gender, ethnic, and color blindness that ecological economics has thus far failed adequately to address. Much of the text, however, is implicitly human-centered. (EE)

Biro, Andrew, "Towards a Denaturalized Ecological Politics," Polity 35 (no. 2, 2002):195-212. Argues for reconceptualizing ecological politics for a postmodern era, a "denaturalization" of ecological politics that avoids both the overly romanticized view of nature that is present in some environmental discourses and the radical skepticism of anti-foundationalist critiques of "nature." Postmodern, exemplified here by the social theory of Jean Baudrillard, can be shown to rely on naturalism to sustain its normative critique. Ecocentrism, on the other hand, must make some allowances for the ways in which our understanding of nature is socially constructed. A way around this apparent impasse of postmodern ecological politics. This paper results from a Ph.D. dissertation at York University, 2000. Biro is in political ecology, Acadia University, Canada.

Biro, Andrew. *Denaturalizing Ecological Politics: Alienation from Nature from Rousseau to the Frankfurt School and Beyond*. Toronto: University of Toronto Press, 2005. Biro begins with a critique of deep ecology—which supposedly prioritizes nature over culture. He then explicates structuralist and poststructuralist social theorists who claim that nature is solely an effect of social human social structures. Biro then discusses Rousseau, Marx, Adorno, and Marcuse to develop a starting point for a denaturalized rethinking of ecological politics. He argues that an adequate understanding of human ecology must see human beings not as biologically separate from nature but as historically differentiated through their self-conscious transformation of the natural environment. After we grasp the complexities of how nature and the social are intertwined, we can work toward a liberatory human ecology by disentangling social relations and processes that serve to reinforce relations of domination.

Bittman, Mark, "Today's Fish: Straight From the Farm," New York Times (9/18/96): B1. Fish farming: Now like Livestock Production. Many believe that the fish they eat once swam free. To be sure, fish continue to be caught in nets and lines, but the number of fish raised on farms has doubled in the last decade. About 10% of the fish sold today in the U.S. was farm-raised, and 50% of the shrimp comes from farms. Salmon, hybridized striped bass, sturgeon, catfish, and trout are most likely to be farm raised. Tuna, cod, flounder, or swordfish are not. Some of the farmed fish are "made-to-order designer products" "fine-tuned to appeal to the restaurant trade and home consumer." Salmon farmers increase fat content to make salmon extra fatty (as sushi chefs prefer); they withhold fat to make salmon extra lean (for smoked fish); and they add fatty acids to improve the nutritional value of the fish. They augment the feed with pigments to give it the brilliant orange color consumers expect. Striped bass farmers control the amount and type of oil in the feed to adjust the level of fishiness. Fish farmers even use antibiotics and other drugs to treat illness. There are also concerns about water pollution from aquaculture. Norway, the pioneer of salmon farming, has closed fjords to swimming because of high concentrations of fish wastes. (v8,#2)

Blackburn, Simon, *The Oxford Dictionary of Philosophy*. Oxford: Oxford University Press, 1996. Contains the following definition: "Environmental ethics: Most ethics deals with problems of human desires and needs.... The central problem specific to thinking about the environment, is the independent value to place on such things as preservation of species, or protection of the wilderness. Such protection can be supported as a means to ordinary human ends.... But many want to claim a non-utilitarian, absolute value for the existence of wild things and wild places; it is in their very independence of human lives that their value consists. They put us in our proper place, and failure to appreciate this value is not only an aesthetic failure but one of due humility and reverence, a moral disability. The problem is one of expressing this value, and mobilizing it against utilitarian arguments.... See also nature, sublime."

Blaney, Alicia Swaine, Environmental Conservation at Multiple Landscape Scales: An Analysis of the Ethical Past, Present, and Future. M.A. thesis, Colorado State University, summer 2006. Environmental ethics is on the forefront of contemporary ethical thought, but its language is problematic, with different parties meaning different things by similar words, often giving rise to conflict and confusion, even by those who share values in common. We do not have available a universal environmental ethic, but there are convictions broadly shared. Ethics is functional at different levels and goes into a webwork of belief. Further issues arise with institutional divisions of the landscape into private and public, rural lands, park lands, national forest lands, wilderness, often producing fragmentation rather than a comprehensive ethic. If this philosophical confusion is to be overcome, and if land is to be appropriately respected, then there must be a new ethic, one that is "loosely naturalized." Such an ethic will begin with the broad assumption that nature exists and has intrinsic value but that an inclusive ethic will move into the cultural realm where subjective interactions at multiple levels are better able to discover and appropriately respect the objective realities in the natural world.

Bliese, John R. E. "Richard M. Weaver, Russell Kirk, and the Environment." Modern Age 38 (1996): 148-58. Conservatives typically ignore environmental concerns, but Russell Kirk and Richard Weaver are prominent traditionalist conservatives who have addressed environmental issues. They reject materialism and argue that what civilization now needs most of all is the practice of self-restraint. They are perfectly willing to have fewer things in return for a healthy environment. They have a fundamental attitude of pious respect for nature as creation. Society is intergenerational and we have an obligation to sustainability. A traditionalist conservative should be horrified at what humans are now doing to the planet. "A traditionalist conservative should be an environmentalist and be foremost among all those who are trying to preserve our temporal home: our earth and all its wonder and all its splendor" (p. 157). Bliese teaches Communication Studies at Texas Tech University. (v7, #3)

Bliese, John R. E. "Traditionalist Conservatism and Environmental Ethics." Environmental Ethics 19(1997):135-151. Environmentalism is usually thought to be a liberal political position, but the two primary schools of thought within the conservative intellectual movement support environmentalism as well. The free market perspective has received considerable attention for its potential contributions to environmental protection, but the traditionalist perspective has not. I consider several important principles of traditionalist conservatism. The traditionalists are not materialists and are highly critical of our consumer culture. They reject ideology and stress piety toward nature, the intergenerational character of society, and prudence in political and social action. These basic principles are a solid foundation for environmentalism. Bliese is in the Department of Communication Studies, Texas Tech University, Lubbock, TX. (EE)

Blignaut, Peter Erle, Framework for a Socio-Resource Zoning Management Policy for the Conservation and Sustainable Utilisation of the Mountainous Areas of South Africa. University of Cape Town, Department of Environmental and Geographical Science, Ph.D. Dissertation, April 1994. The mountainous environments of South Africa are being steadily degraded due to undesirable agricultural activities, over-burning, erosion, invasive vegetation, afforestation, natural resource exploitation, infrastructural developments and a general attitude that mountains comprise 'waste land' that presently has little conservation status. Environmental management for the sustainable use of mountains is urgently required. Blignaut is a land surveyor and town and regional planner. Address: Blignaut and Rommelaere, P. O. Box 334, Parow 7500, South Africa. (v6,#3)

Bloch, Konrad. "Carnivores, Herbivores, and Omnivores." In Blondes in Venetian Paintings, the Nine-Banded Armadillo, and Other Essays in Biochemistry, pp. 228-241. New Haven: Yale University Press, 1994. The genetic basis of obligate carnivores. Cats, wolves, foxes, raccoons, raptors are obligate carnivores, and must eat flesh. Two carnivores, the giant panda and the black bear have become herbivores, the panda eats only bamboo. Domesticated dogs are not obligate carnivores, although their wild ancestors were. Not too much is known about the genetic basis or obligate carnivores, except for the

domestic cat. Four deficiencies are known. Cats lacking taurine and vitamin A, obtained in meat, will go blind from retinal deterioration. Omnivores and herbivores can synthesize taurine, though there is some evidence that taurine deficiency in primates produces less than optimum growth. Bloch is a Nobel laureate biochemist, formerly at Harvard. (v6,#3)

Blueprint for a Green Campus: The Campus Earth Summit Initiatives for Higher Education. Pittsburgh,

PA, USA: Heinz Family Foundation (3200 CNG Tower, 625 Liberty Avenue, 15222, USA), 1995. Available through Campus Green Vote, 1400 16th St., NW, Box 24, Washington, DC 20036; USA, 202-939-3338. Fax 202-797-6646. In February 1994 over 450 faculty, staff, and students from 22 nations, 6 continents, and all 50 U.S. states met at Yale University in a Campus Earth Summit. Here is their set of recommendations for higher education institutions around the globe to work for an environmentally sustainable future. With sections on ten recommendations: 1. Integrate Environmental Knowledge into All Relevant Disciplines. 2. Improve Undergraduate Environmental Studies Course Offerings. 3. Provide Opportunities for Students to Study Campus and Local Environmental Issues. 4. Conduct a Campus Environmental Audit. 5. Institute an Environmentally Responsible Purchasing Policy. 6. Reduce Campus Waste. 7. Maximize Campus Energy Efficiency. 8. Make Environmental Sustainability a Top Priority in Campus Land-Use, Transportation, and Building Planning. 9. Establish a Student Environmental Center. 10. Support Students who Seek Environmentally Responsible Careers.

Bluhdorn (Blühdorn), Ingolfur, Post-Ecologist Politics: Social Theory and the Abdication of the Ecologist Paradigm. London: Routledge, 2000. A post-modernist critique of green political theory. The author criticizes existing green political theory for wanting to change the world, rather than taking it as given and seeking to "green" it, attempting to work with, rather than against, the grain of modern market-based economy. The dynamics of development of modern society are going in an anti-ecological direction. Ecologically-committed thinkers are therefore naive and unrealistic in thinking they can alter this. Therefore they should abandon "castle-building" and get "sociologically real," that is, seek to accommodate and tailor the "ecological project" to the "reality" of advanced, market-based, high consumption society. Blühdorn, Ingolfur. Post-Ecologist Politics: Social Theory and the Abdication of the Ecologist Paradigm. London: Routledge, 2000. An extreme social constructivist. "The concept of the environmental crisis is dubious" (p. 14), but there is a "crisis of the eco-movement" (p. 30), which is now found to be socially constructed. But it is true that nature has been abolished, because it is no longer possible to believe in the existence of a realm of pure objective nature separated from and underlying culture. So we will need a post-ecologist politics. "Ecological thought ... has to become fully anthropocentric and turn into social theory" (p. 39). Nevertheless, Blühdorn concedes that most of the rainforest is gone and that there is great loss of biodiversity. Blum, Deborah, The Monkey Wars. New York: Oxford University Press, 1995. 306 pp. \$ 25. Traces the history of the conflicts over primate experimentation and research. Blum seeks a middle ground where both human and animal lives count, and where we can honestly and calmly ponder the pain/gain equation, how much pain we are willing to inflict to reduce human pain. She finds, for instance, that there will probably be no vaccine for AIDS found without primate research. Blum is a science writer for the Sacramento Bee who received a Pulitzer Prize for an earlier series of newspaper articles on this subject. (v5,#4)

Blum, Elizabeth D. *Love Canal Revisited: Race, Class, and Gender in Environmental Activism*. Lawrence: University Press of Kansas, 2008. Blum argues that Love Canal shows how environmental activism opened up a window on broader social movements and highlighted a legacy rooted in race, class, and gender. She goes beyond headline people such as Lois Gibbs to show how marginalized black women fought to be heard, women who rejected feminism because of a perceived anti-family stance fought as activists for their rights, working class men found their wives in the front lines of activism instead of in the kitchen, and the white, middle class Ecumenical Task Force helped black residents negotiate legal obstacles for relocation and compensation.

Blumener, Earl, "Entrepreneurial Environmentalism: A New Approach for the New Millennium," Environmental Law 30 (No. 1, 2000): 1- . As the environmental movement enters the new millennium, it must confront an array of hurdles. Faced with political stalemate concerning environmental remedies and policy and shrinking public revenues and resources, Congressman Blumener suggests adoption of an entrepreneurial environmentalism strategy. Environmentalism in the coming millennium, according to Congressman Blumener, must provide comprehensive solutions, use "cheap and green" strategies, look to performance based regulations, and encourage economic incentives. (v.11,#4)

Blumenthal, Dana, "Interrelated Causes of Plant Invasion," Science 310(14 October 2005):243-244. Invasive plant species flourish because they land on disturbed sites, similar to those from which they came, but with more resources (such as fertilizer), they have a life-history strategy of making many seeds rather than protecting themselves for long-lives; they are released from their natural enemies (left back where they came from), meanwhile the natives still have their natural enemies to compete with. These factors compound to make invasives especially disruptive to natural systems. Blumenthal is with the USDA Agricultural Research Service Rangeland Research Unit, Fort Collins, CO.

Blumm, Michael C., "Ancient Forests, Spotted Owls, and Modern Public Land Law," Boston College Environmental Affairs Law Review 18 (1991) 605-622. Blumm finds notable how effective citizen environmental groups have been in changing national values. They have succeeded in gaining court injunctions that induced Congress to supply increasing statutory protection for ancient forests. This moved the debate out of the control of the Northwest's congressional delegation and made it a national issue. Environmental groups have insisted that the courts enforce the laws, despite a U. S. Forest Service that had often been captured by the timber industry. The agency entrusted with conserving these forests frequently found its own data used against itself in courts. The question of who ought to manage the forest is unsettled. Congress has ultimate authority, but it hardly has the institutional capacity to manage four million acres of remaining old growth forest. Blumm is in law, Lewis and Clark College. (v5,#4)

Boal, Frederick W. and David N. Livingstone, eds., The Behavioural Environment: Essays in Reflection, Application, and Re-evaluation. London and New York: Routledge, 1989. Hardbound, 337 pages.

Humans behave in their world according to the way they perceive it to be, and this is not always, perhaps not often, the way the world really is. "Decision-makers operating in an environment base their decisions on the environment as they perceive it, not as it is. The action resulting from their decision, on the other hand, is played out in a real environment" (p. 9). These "filtered worlds" (p. 290) are what the late William Kirk, longtime geographer at the Queen's University of Belfast called "the behavioral environment," and two of his colleagues have edited this collection of sixteen essays evaluating that idea. Kirk held that "the behavioral environment" specified the essence of geography and provided it with a unifying model. Geography arises where humans perceive natural systems, and that subjective gestalt, "the behavioral environment," shapes human actions in their worlds, with the real "phenomenal world" responding sometimes more sometimes less than as perceived. The authors here offer sophisticated appraisals of how this model has fared over the last forty years. Perception is important, but is it the essential concept of geography? Somehow, the entwined destinies of nature and culture does seem to be the domain of geography, which could make it a quite relevant science blending the subjective in human perception with the objective in landscapes. Boersema, Jan J. "How to Prepare for the Unknown? On the Significance of Future Generations and Future Studies in Environmental Policy," Environmental Values 10(2001):35-58. The core question of this article is: how can we take account of the future and future generations if our knowledge of the future is so sparse? The importance of the future is discussed within the framework of our (linear) concept of time. After that it is argued that future generations do not constitute a new, let alone unique, element in the debate on the future. Two different routes to acquire knowledge about the future and prepare for the future are described. Both reflect facts and values of the present and the past instead of giving an accurate picture of the future. Finally the view is defended that future-focused activity should be based to a greater extent on durable principles. Some of these durable principles are presented and discussed.

KEYWORDS: Time, future, future generations, durable principles, environmental policy. Jan Boersema is at the Centre of Environmental Science, Leiden University, The Netherlands. (EV)

Boersema, Jan J. "Environmental Quality and the Quality of our Way of Life." Environmental Values 4(1995):97-108. Today, sustainable development is generally accepted as a guiding principle. The present relation societies have with the natural environment is considered as being not-sustainable. However this presupposes some idea about the quality of the environment and of activities affecting the environment and, as a consequence, of the quality of life. In this article I defend the proposition that the limited progress made with respect to the environment - despite all the good intentions - could be due to a potential conflict between 'quality' and sustainable development. In other words: our interpretation of the concept of 'quality' is not compatible with the aims of sustainability. Some consequences for research and policy of accepting this proposition are discussed. KEYWORDS: Quality, sustainable development, lifestyle. Boersma is at the Centre of Environmental Science, University of Leiden. (EV)

Boetzkes, Elisabeth A. and Janson Scott Robert. "Toward an Inclusive Health Ethic for Humans and Ecosystems." Ethics and the Environment 5(2000):143-152. ABSTRACT: Health care ethics has long been concerned with the ethical issues faced by the human individual, issues such as consent, bodily privacy, and autonomy. Since at least the 1970s, however, we have known that health is largely a function of factors extending beyond the individual. Some recent and laudable ethical work has begun to take seriously the social determinants of health. For instance, deciding what would be a just distribution of the social good of health care engages health ethics with social philosophy (e.g., Weston 1991). Raising the health profile of individuals likewise requires social reforms in employment, work hierarchy, early childhood care, and economic equality-all of which have been found to be important determinants of human health (e.g., Ontario 1991). Even the issues of consent and autonomy are currently being

contextualized, as the relevance of such factors as intimate relationships and power asymmetries is recognized (Sherwin 1992). Many researchers now acknowledge that the tendency to reduce health ethics issues to the individual is misleading. For instance, Henry T. Greely (1997) has argued that because most genetics research is, in fact, research about groups—families, the class of people with a particular disease, isolated communities, or ethnic groups, then groups are certainly an appropriate further object of ethical consideration. Furthermore, geneticist, epidemiologist, and ethicist Abby Lippman laments the (often unjustified) tendency to consider genetic contributions to ill health as more manageable, less intractable, than social contributions. Bohannon, John. "The Big Thaw Reaches Mongolia's Pristine North." *Science* Vol. 319, no. 5863 (1 February 2008): 567-68. Mongolia at high latitudes has been warming twice as fast as the global average, and unique ecosystems are being transformed. Four of the worst drought years on record occurred in the past decade. The landscape permafrost is melting, making the land spongy, and the land is drying out, although intense storms have grown more frequent. Wildfires are more likely. Mongolian herders find it increasingly difficult with too many animals on drier lands, making for an overgrazed steppe and leaving behind shrubby wasteland and sparse semi-desert. They face disaster.

Bond, E. J., Ethics and Human Well-Being: An Introduction to Moral Philosophy. Oxford: Blackwell Publishing Co., 1996. Animals appear in an extended footnote. "Rights and justice, which are inseparable, and all the conceptual apparatus that goes with them--reparation, desert, earned merit, punishment, requirement to respect the rights of others--make sense only in connection with persons, and if they seem to make sense with such animals as dogs, cats, and horses that is because of these animals' long association and close relationships with human beings, who may think of them and treat them as if they were persons. ... This is not to say we do not have a moral responsibility toward many species of non-human animals; for their care if they are domestic animals ... or for wild animals in captivity. It is also our responsibility to preserve the habitat of animals in the wild and not to wantonly destroy species after species..." (pp. 247-248). Bond is in philosophy at Queen's University, Kingston, Ontario. (v7,#4)

Bond, Ivan, "The Importance of Sport-Hunted African Elephants to CAMPFIRE in Zimbabwe," TRAFFIC Bulletin 14 (1994): 117-119. Hunting of elephants brought over \$9 million to Zimbabwe, distributed under the Communal Areas Management Program for Indigenous Resources (CAMPFIRE) to local peoples. Some 60 elephants were killed, in a population of 76,000 elephants, and five of these would have been destroyed in any case as problem animals. Hunters are mostly Americans, some Europeans. Local peoples have a much more positive attitude toward elephants when they see these benefits; they now discourage and report the poachers. CITES permits such hunting, but not the sale of elephant products, and this costs these rural communities about \$1 million annually. Pragmatists will love this, but the author does not examine the ethical impact, either on Zimbabweans, Americans, or elephants of having wealthy Americans lay out up to \$35,000 to put down a trophy elephant, with trickle-down benefits to poor Zimbabweans whose annual incomes are a small fraction of this. Bond is with World Wildlife Fund in Harare, Zimbabwe. (v6,#2)

Bonenburg, Marek M., (Philosophy, Jagellonian University of Cracow), Etyka Środowiskowa: Założenia i Kierunki (= Environmental Ethics: Assumptions and Trends). In Polish. Cracow: Jagellonian University, Institute of Philosophy, 1992. 152 pages. Softcover. There is a brief English summary at the end. This is the first book on environmental ethics published in Poland and presents, in short chapters, the main trends in contemporary environmental ethics. Nine approaches to environmental ethics are analyzed, the approaches by Tom Regan, Robin Attfield, Paul Taylor, Aldo Leopold and J. Baird Callicott, Arne Naess, Holmes Rolston, James Lovelock, Edward Goldsmith, and Henryk Skolimowski. The author concentrates on the theoretical justifications of each ethical position and also on its practical consequences. On one side, there is a tendency to concentrate on human relations with nonhuman individuals; on the other there is a tendency to emphasize duties toward ecosystems. Sample chapter titles (translated from Polish): Chapter 1: The Basic Theses of Environmental Ethics. Chapter 2. The Theory of Respect for Nature of Paul Taylor. Chapter 6: Deep Ecology. Chapter 7: The Ecocentric

Theory of Holmes Rolston, III. (Thanks to Jan Wawrzyniak.) (v4,#1)

Bonevac, Daniel, ed., Today's Moral Issues: Classic and Contemporary Perspectives. Mountain View, CA: Mayfield Publishing Co., 1992. With a section on the environment: Carl Sagan, "Pulling the Plug on Mother Earth"; Barry Commoner, "Economic Growth and Environmental Quality: How to Have Both"; William K. Reilly, "The Green Thumb of Capitalism: The Environmental Benefits of Sustainable Growth"; and Gretchen Morengenson with Gale Eisenstodt, "Profits Are for Rape and Pillage." Sagan: "Society is, to put it simply, fouling its nest." That sees Earth as "our nest," and that seems right, but is it "simply our nest," or is that put over-simply, since there are other residents of the nest? (v3,#3)

Bongaarts, John, "Population Policy Options in the Developing World," Science 263 (February 11, 1994):771-776. The population of the developing world is currently expanding at the unprecedented rate of more than 800 million per decade, and despite anticipated reductions in growth during the 21st century, its size is expected to increase from 4.3 billion today to 10.2 billion in 2100. Past efforts to curb this growth have almost exclusively focused on the implementation of family planning programs to provide contraceptive information, services, and supplies. These programs have been partially successful in reducing birth rates. Reproduction rates have declined, often impressively, and the use of contraception has risen, statistically, from 10% to 50%. Further investments in these programs will have an additional but limited impact on population growth; therefore, other policy options, in particular measures to reduce high demand for births and limit population momentum are needed. The problem is increasingly not the unwanted but the wanted child. A serious problem is "population momentum," the tendency of a population to increase dramatically even after birth rates are reduced to a replacement level (2 children per couple). Good summary reading anticipating the U. N. International Conference on Population and Development in Cairo in September 1994. Bongaarts is director of the Research Division, The Population Council, located at the UN Plaza, New York, New York. (v5,#1)

Bonnicksen, Thomas M., America's Ancient Forests: From the Ice Age to the Age of Discovery. New York: John Wiley and Sons, 2000. How the North American forest landscape evolved over the past 18,000 years. A special feature of the book is its self-contained introduction to the early history of Native American peoples and their environment. The author draws on his roots in the Osage nation as well as historical research, and claims that the cultural practices of hunting, agriculture, and fire helped form the ancient forests. "This saga is not just about climate and trees. Native Americans were an integral part of America's forests. The forest and the people who lived there formed an inseparable whole that developed together over the millennia. ... Native Americans helped to create and sustain the ancient forests that Europeans found beautiful enough to set aside in national parks." (p. xi). Bonnicksen is in forest science, Texas A&M University. For vigorous dissent, see Vale, Thomas R., "The Myth of the Humanized Landscape" Natural Areas Journal 18(no. 3, 1998):231-236. (v.12,#4)

Bontiankomah (Bonti-Ankomah), Sam, and Fox, Glenn, "Hamburgers and the Rainforest--A Review of Issues and Evidence," Journal of Agricultural and Environmental Ethics 10(1997/1998):153-182. ABSTRACT: This paper examines the relationship between North American beef consumption and deforestation in South and Central America. Some writers have argued that consumption of hamburgers in North America, particularly hamburgers consumed in fast food restaurants, contributes to the depletion of the rainforest in South and Central America. We survey the published policy literature on the causes of rainforest depletion in the region. We also review the published estimates of the rate and extent of clearing of rainforest that has occurred in South and Central America since 1970. Finally, we review the data on beef imports and consumption in Canada and the United States in a effort to assess the importance of South and Central America as suppliers of beef to the North American market. We conclude that the relationship between beef consumption in North America should not be considered an important cause of forest depletion in South and Central America. Domestic policies and market forces in the countries where rainforests are located are the leading causes of rainforest depletion in this region. This lesson seems to have been lost on some popular and even some textbook writers on this subject. KEY WORDS: Rainforest depletion, hamburger, fast food, Brazilian Amazon. (JAEE)

Boo, Elizabeth. Ecotourism: The Potentials and Pitfalls. 2 vols. Washington, DC: World Wildlife Fund, 1992. Especially Belize, Costa Rica, Dominica, Ecuador, and Mexico. Provisions must be made for protecting the "carrying capacity" of natural sites; local people must have a say in the management of ecotourism; and resources must be invested in access to and care of the amenities. But here is a cautious recommendation of ecotourism. (v6,#1)

Boody, George et al., "Multifunctional Agriculture in the United States", BioScience 55 (no.1, January 2005):27-38(12). We evaluated possible changes to current farming practices in two Minnesota watersheds to provide insight into how farm policy might affect environmental, social, and economic outcomes. Watershed residents helped develop four scenarios to evaluate alternative future trends in agricultural management and to project potential economic and environmental outcomes. We found that environmental and economic benefits can be attained through changes in agricultural land management without increasing public costs. The magnitude of these benefits depends on the magnitude of changes to agricultural practices. Environmental benefits include improved water quality, healthier fish, increased carbon sequestration, and decreased greenhouse gas emissions, while economic benefits include social capital formation, greater farm profitability, and avoided costs. Policy transitions that emphasize functions of agriculture in addition to food production are crucial for creating change. We suggest that redirecting farm payments by using alternative incentives could lead to substantial environmental changes at little or no extra cost to the taxpayer.

Bookchin, Murray, Remaking Society: Pathways to a Green Future. Boston: South End Press, 1990. Pp. 222. A recent and compact expression of Bookchin's central ideas. A leading environmentalist and social critic, Bookchin was inspired to write the book to answer the growing deep ecology trend in environmental philosophy and politics. The deep ecological emphasis on "biocentrism" ignores social theory; it is not humans that are the problem, but social classes and institutions of power which dominate and distort human life. Social institutions have to be remade: "the harmonization of nature cannot be achieved without the harmonization of human with human" (p. 171). Deep ecology is a mindless irrationalism or mysticism that denies the "the place of rationality in life" as the "product of a natural development." Humanity is an "agent for rendering evolution...fully self-conscious...[and]...as rational as possible in meeting non-human and human needs" (p. 204). The debate between the "social ecologists"---followers of Bookchin---and the "deep ecologists" is one of the most disturbing and contentious in the field of environmental philosophy. Bookchin's argument seems based on misunderstandings and extreme interpretations of isolated out-of-context statements. (Katz, Bibl # 2)

Bookchin, Murray, "Recovering Evolution: A Reply to Eckersley and Fox," Environmental Ethics 12(1990):253-274. Arguing that they have seriously misrepresented his views, Bookchin defends his "social ecology" from criticisms of two deep ecologists. The primary issue is the extent and desirability of the human control over nature. Bookchin argues for a "symbiotic relationship between human communities and the nonhuman ecocommunities in which they are located" (p. 259). But he also claims that it is not anthropocentric to diversify an ecological region for the betterment of human life, as long as the project is "very prudent, nonexploitative, and ecologically guided" (p. 272). (Katz, Bibl # 2)

Bookchin, Murray, Which Way for the Ecology Movement Edinburgh and San Francisco: AK Press, 1993. 75 pages. Bookchin is an anarchist who argues that although the problems are extreme, environmentalists have in general gotten the causal sequence backward. Mass poverty, starvation, dispossession, slums, and alienation is not the result of overpopulation, nor the cause of environmental degradation. Rather these crises of human dysfunction and environmental breakdown are the result of a

driving capitalism dependent on growth and consumerism. People have been shoved off the land all over the world by agribusiness. Environmentalists have not understood the true causal forces. Humans are capable of changing these institutional forces, but not until they are correctly understood. (v6,#4)

Bookchin, Murray, Remaking Society: Pathways to a Green Future. (Boston: South End Press, 1990. 204 pages. \$ 10 paper. Social ecologist Murray Bookchin explores the origins of the humans-over-nature hierarchy to find it originates in dominance hierarchies within human societies. These go back to the ascendance of elders in early human society and the dominance of warrior males over other men and nearly all women. It continues in the dominance of nation-states and multi-national corporations. Such hierarchies warp the creative powers of humanity in the service of power rather than of life. Bookchin's ideal is a rational, ecologically oriented society using its cultural achievements for its own benefit and for that of the natural world. Bookchin dislikes the atavistic mystical tendencies he sees emerging in ecofeminists, deep ecologists, and some members of Green political parties. Bookchin is director emeritus of the Institute for Social Ecology in Vermont. (v1,#3)

Bookchin, Murray. "Recovering Evolution: A Reply to Eckersley and Fox." Environmental Ethics 12(1990):253-74. Robyn Eckersley claims erroneously that I believe humanity is currently equipped to take over the "helm" of natural evolution. In addition, she provides a misleading treatment of my discussion of the relationship of first nature (biological evolution) and second nature (social evolution). I argue that her positivistic methodology is inappropriate in dealing with my processual approach and that her Manichaeic contrast between biocentrism and anthropocentrism virtually excludes any human intervention in the natural world. With regard to Warwick Fox's treatment of my writings, I argue that he deals with my views on society's relationship to nature in a simplistic, narrowly deterministic, and ahistorical manner. I fault both of my deep ecology critics for little or no knowledge of my writings. I conclude with an outline of a dialectical naturalism that treats nature as an evolutionary process--not simply as a scenic view--and places human and social evolution in a graded relationship with natural evolution. I emphasize that society and humanity can no longer be separated from natural evolution and that the kind of society we achieve will either foster the development of first nature or damage the planet beyond repair. Bookchin is at the Institute for Social Ecology, Plainfield, VT. (EE)

Boone, Randall B., Kathleen A. Galvin, Philip K. Thorton, David M. Swift, and Michael B. Coughenour. "Cultivation and Conservation in Ngorongoro Conservation Area, Tanzania." *Human Ecology* Vol. 34, no. 6 (2006): 809-28. Ngorongoro Conservation Area, containing Ngorongoro Crater, one of the prime African wildlife habitats, as well as surrounding areas, is not a national park but designated as a conservation area to permit its use by Masai agro-pastoralists. This research examines the extent to which cultivation (in addition to grazing) impacts wildlife. There is no cultivation in the Crater, though there is some grazing. The authors conclude that the present cultivation patterns on surrounding lands (less than one percent of the area) is not overly detrimental to wildlife (or livestock) populations. But they express

concern that increased cultivation increases the Masai population, non-Masai peoples are immigrating into the area to take advantage of cultivation, and cultivation cannot increase proportionately to population increase without both stressing wildlife populations and making the people increasingly dependent on relief aid. Booth, Annie L., and Harvey L. Jacobs. "Ties that Bind: Native American Beliefs as a Foundation for Environmental Consciousness." Environmental Ethics 12(1990):27-43. In this article we examine the specific contributions Native American thought can make to the ongoing search for a Western ecological consciousness. We begin with a review of the influence of Native American beliefs on the different branches of the modern environmental movement and some initial comparisons of Western and Native American ways of seeing. We then review Native American thought on the natural world, highlighting beliefs in the need for reciprocity and balance, the world as a living being, and relationships with animals. We conclude that Native American ideas are important, can prove inspirational in the search for a modern environmental consciousness, and affirm the arguments of both deep ecologists and ecofeminists. The shifting values in natural resources policy decision-making set the stage for a more focused debate on the ethical criteria that should be employed. The natural history of old-growth forests, aboriginal views of forests, valuing forests in the era of exploitation, the Endangered Species Act and old-growth forests. How should old-growth forests be valued? Booth is professor of economics at Marquette University. (v4,#3)

Booth, Douglas E., "Ethics and the Limits of Environmental Economics," Ecological Economics 9(1994):241-252. There are limits to the cost-benefit framework, given the acceptance of an ethic of environmental concern. Two approaches to environmental ethics are considered: one based on the view that humans are the focus of moral concern, the other holding that moral concern ought to be extended to

the nonhuman world. In the first case, cost-benefit analysis can legitimately be applied so long as those humans who suffer losses from environmental damage are adequately compensated. But even in human cases, the application of cost-benefit analysis is inconsistent with the moral considerability of humans in cases where damage is harmful to human health and also in cases where the natural environment is so highly valued that the compensation of damaged parties is infeasible. In the second case, cost-benefit analyses cannot legitimately be applied where nonhuman entities are morally considerable. Booth teaches economics at Marquette University. Any philosopher who thinks that economists do not do their philosophical homework should read the preceding three articles. (v5,#4)

Booth, Douglas E. "Preserving Old-Growth Forest Ecosystems: Valuation and Policy," Environmental Values 6(1997):31-48. ABSTRACT: If valuation processes are dualistic in the sense that ethical values are given priority over instrumental values, and if old-growth forests are considered to be valuable in their own right, then the cost-benefits approach to valuing old growth is inappropriate. If this is the case, then ethical standards must be used to determine whether preservation is the correct policy when human material needs and ecosystem preservation are in conflict. Such a standard is suggested and evaluated in the context of the policy debate over the preservation of spotted owl habitat in the Pacific Northwest region of the U.S. Economics Department, Marquette University, Milwaukee, WI 53233, USA. Booth, William, "Developers Wish Rare Fly Would Buzz Off," Washington Post (4/4/97) A1. Endangered fly creates controversy. The Delhi Sands flower-loving fly is the only fly on the U.S. endangered species list. In order to protect its rare habitat of inland dunes, the U.S. Fish and Wildlife Service is requiring officials in Southern California to move the footprint of a new hospital (at an alleged cost of \$4 million) and to rethink a planned massive industrial development (that is supposed to create 20,000 jobs over 5 years). Critics are characterizing the issue as "jobs versus flies" and casting aspersions at the fly and its habitat. The reporter describes the fly as "a creature that spends most of its life underground, living as a fat, clumsy, enigmatic maggot." Says a State Senator, "I'm for people, not for flies." The habitat, says another official, is "a bunch of dirt and weeds. I can't take a citizen out there without them becoming outraged." Some claim that the Fish and Wildlife Service was considering slowing interstate traffic through the dunes to a crawl during the fly's summer mating season, "lest at fly become a glop on an unsuspecting motorist's windshield." The entomologist responsible for getting the fly listed as endangered in 1993 says the fly "is spectacular . . . If you see one flying around you don't soon forget it." The fly is an inch long and is able to hover like a hummingbird above flowers using a long straw for a mouth to extract nectar. The geology and biology professor who wrote the recovery plan for the fly says "It's a fly you can love. It's beautiful. Nothing is too wonderful to be true in the world of insects." Females of the species telescope their bodies three inches into the sand to deposit a clutch of eggs. The Delhi Sands is the largest remaining sand dune system in the Los Angeles basin, a unique environment that supports not only the fly but also rare and precious flowers, pocket mice and butterflies. This case raises the issue of species egalitarianism and illustrates the argument strategies of both Endangered Species Act opponents and proponents. (v8,#1)

Bophuthatswana National Parks and Wildlife Management Board published a series of occasional papers (at least 16 of them) on policy, ethical, and management issues. Samples: Suping, Victor S (tribal chief of the Botswana) and Roger F. H. Collinson, "The Wildlife Conservation Traditions of the Botswana," Paper no. 2, January 1992; Collinson, Roger F. H., "National Parks: Extravagant or Essential?" Paper no. 6, May 1992; Davies, Richard J., David Grossman and Levy Rammutla, "Wildlife Use and Community Development in Bophuthatswana," Paper no. 13, November 1992; Stuart-Hill, Greg, and David Grossman, "Parks, Profits and Professionalism: An Overview of the Introduction of the Lion to the Pilanesberg National Park."

Borchert, Peter and Maria Jones, "The Environment Must Win: South Africa's Elections," Africa - Environment and Wildlife 2(no.2, March/April 1994):20-26. In South Africa, the need for social upliftment is crucial but many are concerned that the clamor for short-term reparation and economic success could exacerbate the environmental ills that already beset the land. Politicians must be encouraged to acknowledge that the promise of better times is irrevocably linked to a healthy environment. Most of the political parties have fairly well-articulated environmental policies, but this can prove little more than lip service, and South Africa is out of step with developed western nations that do pay serious attention to environmental problems. Some think that a preoccupation with environmental issues is the mark of a privileged few who put the welfare of animals over that of humans. In fact South Africa's biodiversity is one of its major assets.

Tourism is only part of the answer. At worst, ecotourism is an international hotel group putting up a pleasure palace on the edge of a game reserve, staffed with its international staff, and repatriating the profits taken from overseas tourists. At best, ecotourism is "purposeful travel to natural areas, to understand the cultural and natural history of the environment, taking care not to alter the integrity of the ecosystem, while producing economic opportunities that make conservation of natural resources beneficial to local people" (Ecotourism Society). South Africa ought considerably to enlarge its share of the market in better ecotourism. However, the market is finite, the demand can be met with relatively small areas of more or less pristine ecosystems and is generally feasible in a few prime areas, and it is intrinsically unstable, evaporating in time of war, political instability, shifting exchange rates, disease epidemics, perceived personal dangers, and so forth. The larger answer is a spectrum of benefits from conserved natural resources that reach large numbers of ordinary people. Borchert is editor of Africa - Environment and Wildlife; Johns is a freelance journalist. (v6,#3)

Borchert, Peter, "Destination Africa: Turning a Dream into Reality," Africa - Environment and Wildlife 3(no. 3, May/June 1995):27-35. Travel and tourism is, by some measures, the world's largest industry, globally people spend more on tourism than they do for food. Africa offers unparalleled opportunities for tourism, especially its impoverished nations that seem to have little else to offer the world economy other than access to places of great natural beauty. But ecotourism is a mixed bag; done wrong it destroys the assets on which it is based, benefits the rich and not the poor, and escalates further consumption of fuel, water, and materials. Done right it can offer a rational and sustainable use of the continent's great assets in a manner that involves and is of benefit both to Africans and African wildlife. "Tourism is the way in which individuals can savour the unknown, acquire understanding and experience the world in its fullness. Furthermore, tourism stands out as a positive and ever-present factor in promoting mutual knowledge and understanding, and therefore peace and detente" (United Nations World Tourism Organisation, The Hague Declaration on Tourism, 1989). Borchert is editor of Africa - Environment and Wildlife. (v6,#3)

Borenstein, Seth, "Study Finds Oceans in Crisis, but Fixable," Philadelphia Inquirer, June 5, 2003, A21.

The Pew Oceans Commission report, a three-year, \$ 5.5 million study, finds that the oceans bordering the U.S. are overfished, polluted, infested with invasive species, dotted with dead zones, and in a state of crisis, but they can be saved. Bringing the oceans' ecosystems back from the edge of collapse requires dramatic, controversial and expensive efforts to limit fishing, coastal development, and runoff from cities and farms.

Borgmann, Albert, "The Challenge of Nature," Chapter 22, pages 182-196, in Technology and the Character of Contemporary Life: A Philosophical Inquiry. Chicago: University of Chicago Press, 1984. "Nature in its wildness attains new and positive significance within the technological setting. ... Nature constitutes a singular challenge for technology in this country; especially nature in its pristine or wild state. In this latter sense, nature is in an obvious way the counterpart to technology. It is by definition a part of the world that has not been touched by the hand of technology. But though there is a clear distinction between wilderness and technology, it is much less clear why we should prevent technology from crossing the physical counterpart to that distinction and from penetrating the remaining wilderness areas. ... (p. 182)

Wilderness offers some experiences that technology does not. "In the wilderness, time and space are restored to us." "The wilderness is eminently deep." "In all these experiences of the wilderness we also experience ourselves in a new way" (pp. 191-192). "We can learn from the wilderness that pretechnological things are not mere forlorn remnants of an irretrievable order but attain a new splendor in the midst of technology. They teach us both to accept and to limit technology in a principled and sensible way. They allow us to be more fully human in offering us engagement, in calling forth a new maturity, and in demanding a rightful discipline" (pp. 195-196). Borgmann is in philosophy at the University of Montana, Missoula.

Borgmann, Albert. "Gender, Nature, and Fidelity," Ethics and the Environment 4(1999):131-142. Contemporary discussions of gender and nature are likely to suffer from two vexations, the conflict of constructivism and naturalism and the conflict of nativism and rationalism. As a solution to the first I propose postmodern realism and as a remedy for the second a notion of careful scholarship. With the solutions laid out, I will illustrate and test them by discussing friendship and fidelity within the scope of gender and nature. Borgmann is in philosophy at the University of Montana. (E&E)

Borgmann, Albert. *Real American Ethics: Taking Responsibility for our Country*. Chicago: University of Chicago Press, 2006. Borgmann discusses the institutions and tangible structures that Americans have built to create the United States and what kinds of life these make possible, as, for example, the Jeffersonian agrarian democracy. This backdrop that we have built is not neutral, passive, but is infused with moral content that shapes who we are and how we live. Today "ours is a decent country," but one with troubling features, particularly its waning support for values of equality, dignity and justice, and for traditional American concerns for the poor and the environment. Increasingly these values are displaced by the focus on production, consumption, and affluence. Moral malaise and indifference more and more mark U.S. society. "The ground of contemporary culture must be so compacted and barren that a rich and grounded moral vision has a hard time taking root and gaining public support." The urgent moral task is to recognize this relationship, take responsibility for it and ask what kind of life expresses our deepest shared values. Borgmann hopes to "widen the circle of well-being until it includes everyone in this country and on earth." Borgmann's book is reviewed by Dan Spencer, "What Consumes Us: The Deformation of American Values, *Christian Century* Vol. 124, no. 7 (April 3, 2007): 39-42.

Borja, Jordi, Castells, Manuel. The Local and the Global. Covelo, CA: Island Press, 1997. 320 pp. \$35 paper. Urban geographers examine the possibilities for establishing a dynamic and creative relationship between the local and the global that will enable cities to remain the focus of social organization, political

management and cultural expression. (v8,#2)

Bormann, Bernard T., Richard W. Haynes, and Jon R. Martin. "Adaptive Management of Forest Ecosystems: Did Some Rubber Hit the Road?" *BioScience* Vol. 57, no. 2 (2007): 186-91. Although many scientists recommend adaptive management for large forest tracts, there is little evidence that its use has been effective at this scale. One exception is the 10-million-hectare Northwest Forest Plan, which explicitly included adaptive management in its design. Evidence from 10 years of implementation of the plan suggests that formalizing adaptive steps and committing to monitoring worked better than allocating land to adaptive management areas. Clearly, some of the problems in implementing any new strategy should have been expected and probably would have been avoided if the plan had called for even more focused feedback. But decisions made after monitoring results were analyzed have led to new management priorities, including new approaches to adaptive management. These decisions suggest that one adaptive management loop has been completed. A continued commitment to learning about and adapting practices and institutions will most likely be needed to improve performance in the future.

Bormann, F. Herbert and Stephen R. Kellert, eds., Ecology, Economics, Ethics: The Broken Circle. New Haven: Yale University Press, 1991. 233 pages. With contributions by F. Herbert Bormann; William A. Butler; Paul H. Connett; David Ehrenfeld, "The Management of Diversity: A Conservation Paradox"; Thomas Eisner; Malcolm Gillis; William Goldfarb; Wes Jackson, "Nature as the Measure for a Sustainable Agriculture"; Stephen R. Wilson, "Biodiversity, Prosperity, and Value." (v2,#4)

Bormann, Herb), "On Respect for Nature," NRCC News, Northern Rockies Conservation Cooperative (P. O. Box 2705, Jackson, WY 83001), Autumn 2000, no. 13, pp. 4-5. "The biogeochemistry of the forest ecosystem changes with disturbances like cutting or fire and ... the forest ecosystem restores its regulation of biogeochemistry as it repairs itself through growth. The most astounding thing is that this great waxing and waning of the forest and its control over biogeochemistry occurs through the interaction of the abiotic environment with thousands of species of plants, animals and microbes and that it is repeatable. Not only is it repeatable through millennia of modest local, regional, and global disturbances, but ecosystems also have the power of adjustment to new conditions, through evolution of component species and migrations of new species.

The complexity of it all is overwhelming. ... Despite our growing knowledge of the natural world, there is still a vast unknown component to the earth whose extent and effectiveness is supported every day as this green planet sails through forbidding space. We should respect, cherish and change with utmost caution this largely unknown natural world because it works as it is and we are totally dependent on its working." Bormann is emeritus, Yale School of Forestry and Environmental Studies, and celebrated for his designing of the small watershed technique for measurement and analysis of forest ecosystems. (v.11,#4)

Bornett, H.L.I., Guy, J. H., and Cain, P. J., "Impact of animal welfare on costs and viability of pig production in the UK," Journal of Agricultural and Environmental Ethics 16(2003):163-186. The European Union welfare standards for intensively kept pigs have steadily increased over the past few years and are proposed to continue in the future. The aim of this study was to determine the profitability of rearing pigs in a range of housing systems with different standards for pig welfare. Models were constructed to calculate the cost of pig rearing (6-95 kg) in a fully-slatted system (fulfilling minimum EU space requirements, Directive 91630/EEC); a partly-slatted system; a high-welfare, straw-based system (complying with the UK-based Royal Society for the Prevention of Cruelty to Animals, Freedom Food standards) and a free-range system. The results suggest that improved pig welfare can be achieved with a modest increase in cost. KEY WORDS: economics, pig housing, pigmeat, welfare. (JAEE)

Borrelli, Peter, ed. Crossroads: Environmental Priorities for the Future. Washington, D.C.: Island Press, 1988. Pp. xiv, 334. A popular analysis and assessment of the environmental movement in the United States, organized around a series of articles in The Amicus Journal (the magazine of the National Resources Defense Council); and a critical article by Barry Commoner, "The Environment," which originally appeared in The New Yorker (June 1987). Commoner argued that the environmental movement had not been successful in using the powers of government to control pollution or solve other environmental problems. Commoner's criticism led environmental activists to review the successes, the failures, and the outlook for environmental action. This is not a scholarly book, but it is a useful treatment of policy issues in the environmental movement. It contains a journalistic account of environmental philosophers by Peter Borrelli, "The Ecophilosophers," pp. 69-83. (Katz, Bibl # 2)

Borthwick, Bruce, "Disappearing Act: Why is the Dead Sea Dying," Christian Century 120 (no. 3, February 8, 2003):20-21. The Sea of Galilee, the Jordan River, and the Dead Sea are all threatened by increasing water withdrawals and increasing pollution, mostly by Israel but also by Jordan. The Dead Sea has reached its lowest level on record, repeatedly falling lower than the ever lowering "red lines," levels at which upstream water extraction should stop. The flow in and from the Jordan River since the 1960's has dropped 90 percent, and what does flow is almost sewage. In the 1850's, the mouth of the Jordan was 180 yards wide and three feet deep. Now it is a few meters wide, more a creek than a river. Plant and wildlife in and around the lake, the river, and the sea are adversely affected (the Dead Sea had no fish in it, but otherwise was not "dead"). There is much Israel and Jordan could do co-operatively, and initiatives were once underway, but have stalled in the present tensions.

Bosque-Pérez, Nilsa A., Michael O'Rourke, J.D. Wulfhorst, David M. Althoff, Caren S. Goldberg, Merrill Kaylani, Wayde Morse, Max Nielsen-Pincus, Jennifer Stephens, Leigh Winowiecki, and Sanford D. Eigenbrode. "Employing Philosophical Dialogue in Collaborative Science." BioScience Vol. 57, no. 1 (2007): 55-64. Integrated research across disciplines is required to address many of the pressing environmental problems facing human societies. Often the integration involves disparate disciplines, including those in the biological sciences, and demands collaboration from problem formulation through hypothesis development, data analysis, interpretation, and application. Such projects raise conceptual and methodological challenges that are new to many researchers in the biological sciences and to their collaborators in other disciplines. In this article, we develop the theme that many of these challenges are fundamentally philosophical, a dimension that has been largely overlooked in the extensive literature on cross-disciplinary research and education. We present a "toolbox for philosophical dialogue," consisting of a set of questions for self-examination that cross-disciplinary collaborators can use to identify and

address their philosophical disparities and commonalities. We provide a brief user's manual for this toolbox and evidence for its effectiveness in promoting successful integration across disciplines.

Bostock, Stephen St. C., Zoos and Animal Rights: The Ethics of Keeping Animals. London: Routledge, 1993. 227 pages. £ 35.00 cloth, £ 10.00 paper. Bostock unequivocally assigns rights to animals and rejects utilitarianism as a basis for animal protection. But such rights may be justifiably sacrificed if the benefits are compelling from a human-interest viewpoint. Zoo animals rights to well being prevents us from causing physical pain, death, or loss of freedom to them, and the first two are met in well-managed zoos. The third is a special challenge to zoos, but, in the end, "really good captivity is not, to all intents and purposes, captivity at all." Held captive animals can be allowed essentially to continue their natural lives; such animals are captive only in a technical sense and free in a morally important sense. With endangered species, it is better for individuals of critically endangered species to live in artificial environments than not to be born at all. Bostock is the education officer for Glasgow Zoo. (v4,#3).

Bostrom, Magnus, "Environmental Organisations in New Forms of Political Participation: Ecological Modernisation and the Making of Voluntary Rules," Environmental Values 12(2003): 175-193. Environmental organisations have been active since the early 1960s in putting environmental issues on the political agenda and in strengthening the environmental consciousness of the public. The struggle has been successful in the sense that there is now a strong demand for practical solutions among all kinds of actors. It is, however, difficult for states and political actors to manage environmental problems by traditional forms and instruments, due to the complex character of the problems. Therefore, environmental organisations take their own initiatives to participate in policy-making by developing new forms, within new arenas, with the help of new instruments (voluntary rules or standards). Special attention is paid to the possibilities of identifying and developing constructive roles in relation to other actors and institutions as well as the capacity to organise standardisation projects and to mobilise and make use of power resources such as symbolic capital and knowledge. In order to interpret characteristics and implications (possibilities and limitations) of standardisation strategies, I draw on the ecological modernisation

perspective. Empirically, I refer to the role of Swedish environmental organisations in standardisation projects such as eco-labelling. (EV)

New York: Springer-Verlag, 2001. (v.12,#4)

Botteron, Cynthia Ann, What the Study of Tiger Preservation in India Reveals about Science, Advocacy, and Policy Change, Ph.D. thesis, in political science, University of Texas-Austin, 2000. Investigates the legitimacy of the claim that imperialism was the motive and mode of transferring from one cultural context to another the "wilderness" version of "national parks" as a means of saving species and habitat, specifically with reference to tigers in India. The vast and powerful role played by the coalition of conservation scientists and international environmental organizations in creating and promoting this "ethic" has largely been ignored by policy theorists. These activities are here analyzed as is the impact on the development of science by its close association with environmental advocacy organizations. This "constructed" science was used to delegitimize alternative interpretations of the problem of species decline, habitat degradation, and the role and function of humans in the environment. The advisor was David Braybrooke. Botteron can be contacted at the Department of Political Science, Colorado State University, Fort Collins, CO 80523. E-mail: cynn@lamar.colostate.edu. (EE v.12,#1)

Botzler, Richard G., and Armstrong, Susan J., eds., Environmental Ethics: Divergence and Convergence, 2nd edition. New York: McGraw Hill, 1998. 600 pages. A second edition of one of the more popular anthologies. Based on feedback from the first edition, there are new sections on conflict resolution, biodiversity, environmental justice, environmental restoration, and genetic engineering, with deletions so as to make the text reasonably compact. 28 of 72 articles are new. Botzler is in wildlife science, Armstrong in philosophy at Humboldt State University, California. (v.8,#4)

Botzler, Richard, and Armstrong, Susan, eds. Environmental Ethics: Divergence and Convergence. 2nd ed. New York: McGraw-Hill, 1998. This second edition of a widely-used anthology expands the first edition (1993) with 26 new essays in a multi-disciplinary format with teaching aids. New topics are genetic engineering, ecological restoration, free market environmentalism, environmental justice, creation spirituality, and conflict resolution. (v9,#2)

Boudreaux, Donald J., Meiners, Roger E. and Zywicki, Todd J., "Talk is Cheap: The Existence Value Fallacy," Environmental Law 29 (No. 4, 1999): 765- . Environmental law and policy has increasingly recognized the concept of "existence value" - the "nonuse value" that individuals derive solely from the knowledge that an environmental amenity exists and not from its use. Because of its nonuse nature, existence value cannot be calculated through market transactions, but can be ascertained only through contingent valuation studies that purport to provide hypothetical valuations. This article questions the conceptual importance of existence value and the validity of contingent valuation as a means for deriving existence value. (v.11,#2)

Bowers, C. A., Education, Cultural Myths, and the Ecological Crisis: Toward Deep Changes. Albany, NY: State University of New York Press, 1993. What our priorities should be in public school and university education as we face the environmental crisis. How our cultural beliefs contribute to the accelerating degradation of the environment as the most fundamental challenge we face. All other social and educational reforms must be assessed in terms of whether they mitigate or exacerbate the ecological crisis. Thought patterns formed in the past are reproduced through the metaphorical language used in the classroom, with the result that both conservative and liberal educators and their critics ignore the ecological crisis. Aldo Leopold, Wendell Berry, and Gregory Bateson suggest a more ecologically sustainable ideology. Bowers teaches education at Portland State University, Oregon. (v6,#2)

Bowers, C. A., Education, Cultural Myths, and the Ecological Crisis: Toward Deep Changes. Albany, NY: State University of New York Press, 1993. 232 pages. \$ 12.95 paper. "The cultural dimensions of the ecological crisis raise profound questions for educators who play such a key role in passing on the cultural templates to the next generation." Most teaching in U.S. schools and universities, whether liberal or conservative, promotes attitudes that lead to overconsumption and pollution. Most reform advocates do not see how there must be a "radical reform of the educational process." Bowers teaches at Portland State University and at the University of Oregon. (v4,#2)

Bowers, C. A. "The Case against John Dewey as an Environmental and Eco-Justice Philosopher." Environmental Ethics 25(2003):25-42. Environmentally oriented philosophers and educational theorists are now attempting to clarify how the ideas of John Dewey can be used as the basis for changing cultural practices that contribute to the ecological crisis. Although Dewey can be interpreted as a nonanthropocentric thinker and his method of experimental inquiry can be used in eco-management projects, Dewey should not be regarded as an environmental and eco-justice philosopher—and by extension, his followers should not be regarded in this light. (1) Dewey's emphasis on an experimental mode of inquiry did not take account of the knowledge systems of other cultures—particularly cultures

that are more ecologically centered. (2) Dewey's understanding of language prevented him from recognizing how the root metaphors (meta-cognitive schemata) he took for granted were also the basis, with several exceptions, of the Industrial Revolution. (3) Dewey's failure to understand the complex nature of tradition, including the different ways in which intergenerational knowledge is shared and renewed, makes it difficult for his followers to address a central eco-justice issue—which is to regenerate within diverse cultural communities the non-commodified forms of knowledge, skills, and relationships that enable individuals and communities to have a smaller ecological footprint. (EE)

Bowers, C. A. "The Conservative Misinterpretation of the Educational Ecological Crisis." Environmental Ethics 14(1992):101-27. Conservative educational critics (e.g., Allan Bloom, Mortimer Adler, and E. D. Hirsch, Jr.) have succeeded in framing the debate on the reform of education in a manner that ignores the questions that should be asked about how our most fundamental cultural assumptions are contributing to the ecological crisis. In this paper, I examine the deep cultural assumptions embedded in their reform proposals that further exacerbate the crisis, giving special attention to their view of rational empowerment, the progressive nature of change, and their anthropocentric view of the universe. I argue that their form of conservatism must be supplanted by the more biocentric conservatism of such thinkers as Aldo Leopold, Wendell Berry, and Gary Snyder. Bowers is at the College of Education, University of Oregon, Eugene, OR. (EE)

Bowers, C. A., The Culture of Denial: Why the Environmental Movement Needs a Strategy for Reforming Universities and Public Schools. Albany, NY: State University of New York Press, 1997. The flaws in contemporary education. The complicity of the educational establishment in supporting the social and economic institutions that have produced the environmental crisis. Education from the primary grades through the universities needs to be totally reformed to support new, ecologically sustainable societies. Bowers formerly taught at the University of Oregon and at Portland State University. (v8,#3)

Bowles, Ian A., Rice, R. E., Mittermeier, R. A., and da Foneca, G.A.B., "Logging and Tropical Forest Conservation," Science 280(1998):1899-1900. Environmental and development organizations have poured hundreds of millions of dollars into sustainable forestry, but these investments have produced few results. Outside plantations, less than 0.02 percent of the world's tropical forests are managed sustainably for timber. The major barrier to sustainable forestry's success is basic economics. Reaping a one-time harvest of ancient trees today is simply more profitable than managing for future harvests. The World Bank is the largest funder of forestry projects worldwide. In the face of a World Bank initiative to establish 500 million acres of sustainable forestry by 2005, scientific evidence is mounting that sustainable harvests may damage biodiversity more than standard logging practices. Summary and further details in Tangle, Laura, "Sustainable Logging Proves Unsupportable," U.S. News and World Report, June 29, 1998, pp. 63-64. (v9,#2)

Bowman, Douglas, Beyond the Modern Mind: The Spiritual and Ethical Challenge of the Environmental Crisis (New York: Pilgrim Press, 1990) \$ 10.95. Deep cultural-religious roots of the environmental crisis are explored. Spirit-Nature dualism is Earth-destructive. Mechanism, materialism, individualism, and patriarchalism reinforce the pattern. Bowman wants to recover the Christian creation-centered tradition in ways that connect with Trinitarian belief and follow Jesus in being "receptive, prophetic, compassionate." (v1,#4)

Boyd, Freeman, "Humane Slaughter of Poultry: The Case Against the Use of Electrical Stunning Devices", Journal of Agricultural and Environmental Ethics 7(1994):221-236. Is the use of electrical stunners adequately discharging our moral obligations with respect to the humane slaughter of poultry? Three separate lines of investigation show that we cannot give an unequivocal answer to this question. Five potentially humane methods of poultry slaughter are examined. Electrical stunning is found to be an acceptable method of rendering birds unconscious before slaughter. We lack sufficient evidence to claim that it is the most humane method currently available and that a proper stun is always achieved. Controversy surrounding the increased current flow and the impact of electrocution on carcass quality and operator safety will continue to cause resistance to the adoption of this method of poultry slaughter. The conclusion offers four recommendations that follow from the cumulative results of these investigations. Boyd lives in Meaford, Ontario.

Boyd, James, "What's Nature Worth? Using Indicators to Open the Black Box of Ecological Evaluation," Resources (Resources for the Future), Summer, 2004, Issue no. 154, pages 18-22. The value of nature is inherently complex; rarely is there a clear-cut, "right" answer to a question like which ecosystem is the most valuable. A central problem is that complex answers, including economic and ecological measures, are difficult to convey to the public. But unless they are clearly conveyed, the public is not convinced by scientists and economists. One line of solution is to use "indicators." Boyd is with Resources for the Future. (v. 15, # 3)

Boykoff, Maxwell T. "From convergence to contention: United States mass media representations of anthropogenic climate change science." *Transactions of the Institute of British Geographers* Vol. 32, no. 4 (2007): 477-89. This article focuses on connected factors that contribute to US media reporting on anthropogenic climate change science. It analyzes US newspapers and television shows from 1995 to 2006 as well as semi-structured interviews with climate scientists and environmental journalists. Through analyses of power and scale, the paper brings together issues of framing in journalism to questions of certainty/uncertainty in climate science. The paper examines how and why US media have represented conflict and contentions, despite an emergent consensus view regarding anthropogenic climate science.

Bracke, M. B. M., K. H. De Greef and H. Hopster, "Qualitative Stakeholder Analysis for the Development of Sustainable Monitoring Systems for Farm Animal Welfare," Journal of Agricultural and Environmental Ethics 18(2005):27-56. Evaluating animal welfare in the animal-product market chain is a key challenge to further improve the welfare of farm animals and information on the welfare of animals must, therefore, be assessed objectively, for instance, through monitoring. Interviews with Dutch stakeholder representatives were conducted to identify their perceptions about the monitoring of animal welfare. While producers tend to perceive welfare from a production point of view, consumers use visual images derived from traditional farming and from the animals natural environments. Scientists perceptions of animal welfare are affected by the need to measure welfare with quantifiable parameters. Retailers and governments (policy makers) have views of welfare that are derived from their relationships with producers, consumers, non-governmental organizations (NGOs), and scientists. All interviewed stakeholder representatives stated that animal welfare is important. Keywords animal welfare assessment - housing and management systems - monitoring - on-farm - stakeholder analysis. The authors are in animal science, Wageningen University and Research Centre, Lelystad, The Netherlands. (JAEE)

Bracke, M. B., J. H. M. Metz, A. A. Dijkhuizen, and B. M. Spruijt. "Development of a Decision Support System for Assessing Farm Animal Welfare in Relation to Husbandry Systems: Strategy and Prototype." Journal of Agricultural and Environmental Ethics 10(2001):321-337. Due to increasing empirical

information on farm animal welfare since the 1960s, the prospects for sound decisionmaking concerning welfare have improved. This paper describes a strategy to develop a decision-making aid, a decision support system, for assessment of farm animal welfare based on available scientific knowledge. Such a decision support system allows many factors to be taken into account. It is to be developed according to the Evolutionary Prototyping Method, in which an initial prototype is improved in reiterative updating cycles. This initial prototype has been constructed. It uses hierarchical representations to analyse scientific statements and statements describing the housing system. Welfare is assessed from what is known about the biological needs of the animals, using a welfare model in the form of a tree that contains these needs as welfare components. Each state of need is assessed using welfare relevant attributes of the housing system and weighting factors. Attributes are measurable properties of the housing system. Weighting factors are assigned according to heuristic rules based on the principle of weighting all components (attributes and needs) equally, unless there are strong reasons to do otherwise. Preliminary tests of the prototype indicate that it may be possible to perform assessment of farm-animal welfare in an explicit way and based on empirical findings. The procedure needs to be refined, but its prospects are promising. Keywords: animal welfare assessment, decision support system, pigs. The authors are at the DLO-Institute of Agricultural and Environmental Engineering Wageningen, The Netherlands. (JAEE)

Bracke, M. B. M., and H. Hopster, "Assessing the Importance of Natural Behavior for Animal Welfare," Journal of Agricultural and Environmental Ethics 19(2006):77-89. The concept of natural behavior is a key element in current Dutch policy-making on animal welfare. It emphasizes that animals need positive experiences, in addition to minimized suffering. This paper interprets the concept of natural behavior in the context of the scientific framework for welfare assessment. Natural behavior may be defined as behavior that animals have a tendency to exhibit under natural conditions, because these behaviors are pleasurable and promote biological functioning. Animal welfare is the quality of life as perceived by the animal. Animals have evolved cognitive-emotional systems ("welfare needs") to deal with a variable environment. Animals do not only have so-called physiological needs such as the need for food, water, and thermal comfort. They also need to exercise certain natural behaviors such as rooting or nest-building in pigs, and scratching or dust-bathing in poultry. All needs must be taken into account in order to assess overall welfare. The degree of need satisfaction and frustration can be assessed from scientific information about the intensity, duration, and incidence of (welfare) performance criteria such as measurements of behavior and/or (patho)physiology. Positive welfare value relates to how animals are inclined to behave under natural conditions, in preference tests, and in consumer-demand studies. Negative welfare value relates to stress, frustration, abnormal behavior, aggression, and reduced fitness. Examples are given to illustrate how the need to perform natural behaviors can be assessed following the general principles for welfare assessment, providing a first approximation of how different natural behaviors affect animal welfare. Keywords: Animal welfare - assessment methodology - model - natural behavior. The authors are with the Animal Sciences Group, Division Animal Resources Development, Wageningen University and Research Centre, Lelystad, The Netherlands. (JAEE)

Braden, Kathleen. "On Saving the Wilderness: Why Christian Stewardship is Not Sufficient," Christian Scholars Review 28(No.2. 1998):254-269. The relationship between humanity and the earth is considered through three phases: the wild earth, the tamed earth, and the tended earth, as grounded in arguments for

an either biblically based dominion or a stewardship worldview. Braden suggests that stewardship alone is an insufficient ethic for preserving wilderness areas and wildlife because it calls for management of that which is inherently unmanageable by humans. Instead, a loving restraint of human action based on Matthew is demanded. (v.11,#2)

Braden, Kathleen. "Personal Reflections on the Fate of Wilderness Reserves in Russia." *International Journal of Wilderness* Vol. 14, no. 2 (2008): 39-43. From the article: "Nature is dying in Russia.... At this moment of greatest need, the network of Russian nature reserves that saves pockets of Eurasia's threatened species has fallen on hard times. Many reserves exist on paper only; most are under siege, and all are severely understaffed." Braden is in geography at Seattle Pacific University.

Bradford, George, How Deep is Deep Ecology? With an Essay-Review on Woman's Freedom. Ojai, CA: Times Change Press, 1989. P. ix, 84. This is an expanded version of an article originally appearing in the magazine *Fifth Estate*. It reviews the deep ecological philosophy of Arne Naess, George Sessions, and Bill Devall, and the practical program of Earth First! from the perspective of an anarchist social critique. Deep ecologists overlook the "interlocking, armored juggernaut" of "capital, technology, and the state" which is the real cause of environmental problems (p. 50). "Deep ecologists err when they see the pathological operationalism of industrial civilization as a species-generated problem rather than as one generated by social phenomena that must be studied in their own right" (p. 10). It is true that deep ecologists must put their arguments into a broader context of social philosophy and philosophy of technology; but this social criticism of deep ecology fails to understand the true structure of environmental problems: the separation of humanity from nature because of narrow anthropocentric thinking. (Katz, Bibl # 2)

Bradley, Ben, "The Value of Endangered Species," Journal of Value Inquiry 35(2001):43-58. There are three prevailing accounts of justifications for saving endangered species: (1) Robert Elliot argues that the last members of a species have greater intrinsic value. (2) Holmes Rolston, III, Alastair Gunn, and Nicholas Rescher argue that species themselves have intrinsic value. (3) Robin Attfield argues that eliminating a species has negative instrumental value. But all these attempted justifications are inadequate. Philosophers have failed to realize that intrinsic and instrumental value are not the only types of value at issue. If we recognize the existence of contributory value, along with Brentano's principle of

bonum variationis, we may be able to defend a preservationist account of endangered species. Bradley is in philosophy, Virginia Polytechnic Institute and State University. (v.13, #3)

Bradley, Ian, God Is Green: Ecology for Christians. New York: Doubleday Image Books, 1990. 118 pages. Paper. \$ 8.00. Chapter titles: God's concern for all creation: "The earth is the Lord's and the fullness thereof." The dance of creation: "The trees of the field shall clap their hands." The fall of nature: "The whole creation has been groaning in travail." The cosmic Christ: "Who is this that even the winds and sea obey him?" The role of human beings: "Thou hast given him dominion over the works of thy hands." An analysis of the biblical understanding of the goodness of creation and of human stewardship, suitable for use in churches. A sacred world is at the heart of Christian belief. Of all the world religions, Christianity has the greatest claim to be environmentalist because it professes that God is incarnate in the very stuff of nature. With practical suggestions for greening the churches. Bradley is a minister in the Church of Scotland and a member of the Green Party. (v5,#2)

Bradstock, Ross A., Williams, Jann E., and Gill, A. Malcolm, eds., Flammable Australia: The Fire Regimes and Biodiversity of a Continent. Cambridge: Cambridge University Press, 2001. Fire is pivotal to the functioning of Australian ecosystems and affects the distribution and abundance of the continent's unique and highly diverse range of plants and animals. Conservation of this biodiversity requires an understanding of the action of fire on the landscape. Natural fire has waxed and waned over geological times on Australian landscapes, mostly associated with climatic changes, and going back into the Tertiary period and before (over 1 million years). "There is a notable increase in fire activity centered on 40 ka before present (BP) [40,000 years ago] which, in the absence of a major climate change in around this time, is considered to mostly likely indicate early Aboriginal burning. The impact on the vegetation was largely to accelerate existing trends rather than to cause a wholesale landscape change. It is difficult to separate the effects of climate change and human-induced burning subsequent to this time until the arrival of Europeans" (p.3). Bradstock is with the Biodiversity Research Group of the New South Wales Parks and Wildlife Service, Australia. (v.13, #3)

Brady, Bernard and Mark Neuzil, *A Spiritual Field Guide: Meditations for the Outdoors*. Grand Rapids, MI: Brazos Press, 2004 A field guide for people of faith who want to be more deeply in touch with God's good Earth and to attend to God's voice in nature. One needs to "pay attention" in and to nature. The outdoors can awaken sensibilities of dependence, gratitude, responsibility, hope, and purpose.

Brady, Emily, "Don't Eat the Daisies: Disinterestedness and the Situated Aesthetic," Environmental Values 7(1998):97-114. In debates about nature conservation, aesthetic appreciation is typically understood in terms of valuing nature as an amenity, something that we value for the pleasure it provides. In this paper I argue that this position, what I call the hedonistic model, rests on a misunderstanding of aesthetic appreciation. To support this claim I put forward an alternative model based on disinterestedness, and I defend disinterestedness against mistaken interpretations of it. Properly understood, disinterestedness defines a standpoint which precludes self-interest and utility, and it does not entail a passive subject abstracted from who they are. This standpoint is compatible with a 'situated aesthetic' in which appreciation of aesthetic qualities is grounded in an embedded subject who is sensitive to the context and narrative of the object. The alternative model provides a conception of aesthetic value which distinguishes it from amenity value, and it also defines a non-instrumental approach that offers the opportunity for enhanced appreciation and attention to nature's value. KEYWORDS: Disinterestedness, aesthetic value, environmental aesthetics, natural beauty. Emily Brady is at Lancaster University, UK. (EV)

Brady, Emily, "Aesthetics in Practice: Valuing the Natural World," Environmental Values 15(2006): 277-291. Aesthetic value, often viewed as subjective and even trivial compared to other environmental values, is commonly given low priority in policy debates. In this paper I argue that the seriousness and importance of aesthetic value cannot be denied when we recognise the ways that aesthetic experience is already embedded in a range of human practices. The first area of human practice considered involves the

complex relationship between aesthetic experience and the development of an ethical attitude towards the environment. I then discuss how aesthetics has played a role in scientific study and the use of evaluative aesthetic concepts in science, such as variety and diversity. The final section shows the connection between the beneficial effects of aesthetic engagement with nature and the restorative value of nature for human well-being. (EV)

Brady, Emily. "Aesthetic Character and Aesthetic Integrity in Environmental Conservation." Aesthetics plays an important role in environmental conservation. In this paper, I pin down two key concepts for understanding this role, aesthetic character and aesthetic integrity. Aesthetic character describes the particularity of an environment based on its aesthetic and nonaesthetic qualities. In the first part, I give an account of aesthetic character through a discussion of its subjective and objective bases, and I argue for an awareness of the dynamic nature of this character. In the second part, I consider aesthetic character in a conservation context. I develop the diachronic concept of aesthetic integrity to guide decisions about how to manage change to aesthetic character. My argument is illustrated with a case study of the proposal for a superquarry on the remote isle of Harris in Scotland. Environmental Ethics 24(2002):75-91. (EE)

Braks, Andrew David, Aristotle's Primary Substance: The Bio-Platonic Motivations Behind Metaphysics Z and H. Colorado State University, Philosophy M.A. thesis, fall 1997. Aristotle stood in the legacy of Plato, but had much more interest in biology. His thought developed and for him, in the Metaphysics, primary substances are species forms. They define concrete individual substances, although in Aristotle's earlier thought in the Categories substances are primarily individuals. But Aristotle is unable to entertain ideas similar to modern evolutionary ideas. His biological species-forms are essentially unchanging and perpetually instantiated by a never-failing succession of living individuals. (v.8,#4)

Brams, Steven J., and Taylor, Alan D. Fair Division: From Cake-Cutting to Dispute Resolution. New York: Cambridge University Press. 1996. Mathematics and algorithms for conflict resolution, such that all parties are maximally satisfied. With two persons, it is easy. Cutting a cake, you cut, I choose. With three persons and more variables, it is harder. With multiple parties and many variables, there are still procedures. All parties list in secret all the disputed items and rank order them. A mediator can use a procedure called "adjusted winner," and Brams and Taylor demonstrate mathematically that any allocation resulting will be both maximally equitable and what they call "envy free," that is, disputants will be maximally satisfied that they got the best outcome they could under the circumstances. The procedure has been used in divorce settlements, in business disputes, and retrospectively on the 1978 Camp David agreement between Egypt and Israel. A major difficulty is that scheming parties can anticipate the other parties' rankings and skew the results. There are many possibilities for the resolution of environmental disputes. Brams is in political science at New York University. Taylor is a

mathematician at Union College, Schenectady, NY.

Bramwell, Anna, Ecology in the 20th Century: A History. New Haven: Yale University Press, 1989. Pp. xii, 292. A work of intellectual, political, and environmental history. Bramwell argues that the roots of contemporary environmental politics---the "green" movement---derived from developments in two sciences at the end of the nineteenth century: holistic biology and the economics of non-renewable and scarce resources. Of particular interest is the shift from the right to the left side of the political spectrum. (Katz, Bibl # 2)

Bramwell, Anna, The Fading of the Greens: The Decline of Environmental Politics in the West. New Haven: Yale University Press, 1994. 216 pages. \$ 25. Greens have had a major political impact, but they do not win any elections. How green consciousness became skewed in political practice, preventing the greens from attracting the support they needed, largely due to the dominance of the German greens and their atypical characteristics. The green frontier now lies with international organizations, not political parties. People are muting their conservation concerns and protests against pollution and environmental degradation to give economic reform a chance. An October conference involving U. S. and Soviet scientists was titled, "The Social, Political, and Cultural Dimensions of the Environmental Crisis in the U.S. and the U.S.S.R. (v3,#1)

Branigin, William, "Immigration Policy Dispute Rocks Sierra Club," Washington Post (3/7/98): A2. Immigration's effect on U.S. population provokes Sierra Club debate. The official Sierra Club policy is to take no position on U.S. immigration levels. This has caused a faction in the Club to launch a referendum attempting to force club leadership to adopt a policy calling for ending U.S. population growth by means of birth control and a reduction in net immigration. Club director Carl Pope believes that although "overpopulation is, without question, a fundamental cause of the world's ills," he also believes that "these are fundamentally global problems; immigration is merely a local symptom." Furthermore, Pope argues that adopting such a policy would lead to the perception that the Club is assisting people with racist motivations. Supporters of the position favoring immigration reduction included Lester Brown and E.O. Wilson. One activist claims the issue is "a question of being environmentally correct versus being politically correct." U.S. population now stands at 269 million, and legal and illegal immigration add about 1.2 million people a year. When U.S.-born children of recent immigrants are included in the equation, immigration accounts for more than half of today's population growth. Mainly because of high fertility rates of immigrant women, the Census Bureau has sharply revised its projections of U.S. population by the middle of the next century. Instead of leveling off at 300 million, the estimate is now that the population will reach 400 million by 2050 and keep growing. Immigration-control activists assert that this estimate is too low because it is based on levels of immigration significantly lower than current numbers. They believe that 500 million is a more likely projection. The immigration reduction referendum was defeated by Club membership. (v9,#2)

Bratton, Susan Power, and Hinz, Shawn, "Ethical responses to commercial fisheries decline in the republic of Ireland," Ethics and the Environment 7(no. 1, 2002):54-91. An open-ended questionnaire elicited concepts of virtue and duty, and ethical language and priorities from commercial fishers and residents of ports in the Republic of Ireland. Respondents came from viable and stressed fisheries and from nontraditional and traditional natural resources communities (including one in Gaeltacht). In reporting the characteristics of a "good" fisher, viable fisheries emphasized virtues such as work ethic, respect for the crew, and respect for the sea. The responses from stressed fisheries materialized virtue, and decreased emphasis on interpersonal relationships while increasing emphasis on owning a large vessel, investing, and being greedy. Most noble actions primarily concerned rescues and sharing equipment and

time in difficult circumstances. Worst actions concerned physical damage to gear, persons, or to the marine environment. Respondents personified the sea, and used similar vocabulary to express care for people and for marine organisms. Although respondents from all communities thought over-fishing and illegal fishing were threats to the fishery, respondents from viable fisheries were more likely to believe they could take personal conservation action to protect the fishery, while those from stressed fisheries despaired of personal protective action and believed that nothing could be done, or that excluding the foreign fleets was necessary for Irish fisheries to recover. European Community policies often conflict with the norms of traditional, artisanal fishers. (E&E)

Bratton, Susan Power. "The Original Desert Solitaire: Early Christian Monasticism and Wilderness." Environmental Ethics 10(1988):31-53. Roderick Nash's conclusion in Wilderness and the American Mind that St. Francis "stood alone in a posture of humility and respect before the natural world" is not supported by thorough analysis of monastic literature. Rather St. Francis stands at the end of a thousand-year monastic tradition. Investigation of the "histories" and sayings of the desert fathers produces frequent references to the environment, particularly to wildlife. In stories about lions, wolves, antelopes, and other animals, the monks sometimes exercise spiritual powers over the animals, but frequently the relationship is reciprocal: the monks provide for the animals and the animals provide for the monks. This literature personifies wild animals and portrays them as possessing Christian virtues. The desert monk is portrayed as the "new Adam" living at peace with creation. Some of the literature is anti-urban, with the city treated as a place of sin, the desert a place of purification. The wilderness functions much as a monk's cell, providing freedom from worldly concerns and a solitary place for prayer and contemplation. The monks' relationship to the desert is evidence of their spiritual progress. (EE) Interesting review of the historical sources and stories of the early Christian fathers and their relationship to wilderness as a place of spiritual enlightenment. Bratton, Susan Power, "Thinking Like a Mackerel: Rachel Carson's Under the Sea-Wind as a Source for a Trans-ecotonal Sea Ethic," Ethics and the Environment 9(no. 1, 2004):1-22. In contrast to "the land ethic," Rachel Carson's Under the Sea-Wind suggests a trans-ecotonal sea ethic, which understands human's perception as inhibited by ecotones, such as shorelines and the ocean surface, and suggests four foundational concepts: 1.) Humans are not fully adapted to life in the oceans. 2.) Humans need to understand the scale and complexity of ocean ecosystems. 3.) Humans disrupt ocean ecosystems by overharvesting their productivity, and modifying ecosystem processes and linkages, such as migrations. 4.) Human imagination and rational scientific investigation can traverse the ecotones, allowing us to more fully value ocean life and processes. Bratton is in environmental studies, Baylor University, Waco, TX. (E&E)

Bratton, Susan Power. "Loving Nature: Eros or Agape?" Environmental Ethics 14(1992):3-25. Christian ethics are usually based on a theology of love. In the case of Christian relationships to nature, Christian environmental writers have either suggested eros as a primary source for Christian love, without dealing with traditional Christian arguments against eros, or have assumed agape (spiritual love or sacrificial love) is the appropriate mode, without defining how agape should function in human relationships with the nonhuman portion of the universe. I demonstrate that God's love for nature has the same form and characteristics as God's love for human beings, and that because agape is self-giving, it is preferable to eros in relationships with the environment. Agape concerning nature (1) is spontaneous and unmotivated, (2) is indifferent to value, (3) creates value, (4) initiates relationships with the divine, (5) recognizes individuality, (6) provides freedom, and (7) produces action and suffering. Agape might best be defined, not as Platonic ascent above the world, but as completely self-giving engagement with the world. Human love for nature is often limited by a human inability to accept love, including divine love, from nature. Flowing from God, agape cannot require reciprocity; yet, agape understands what "the other" has to give

and can offer it complete valuation. Agape is the ideal form of human interaction with nature, because agape does not require equal status or ability, or common goals or needs. Love between humans and members of the land (or sea) community can be sacrificial, and should be distinguished by a loss of self-regard and a willingness to suffer. Further philosophical and theological discussion of the role of reciprocity and sacrifice in love for nature is highly desirable. Bratton is in the department of Natural Sciences, Messiah College, Grantham, PA. (EE)

Bratton, Susan Power. Review of Beauty of the Lord. By Richard Cartwright Austin. Environmental Ethics 11(1989):277-80.

Bratton, Susan Power. "Luc Ferry's Critique of Deep Ecology, Nazi Nature Protection Laws, and Environmental Anti-Semitism," Ethics and the Environment 4(1999):3-22. Neo-Humanist Luc Ferry (1995) has compared deep ecology's declarations of intrinsic value in nature to the Third Reich's nature protection laws, which prohibit maltreatment of animals having "worth in themselves." Ferry's questionable approach fails to document the relationship between Nazi environmentalism and Nazi racism. German high art and mass media historically presented nature as dualistic, and portrayed Untermenschen as unnatural or inorganic. Nazi propaganda excluded Jews from nature, and identified traditional Jews as cruel to animals. Ferry's idealization of Humanism under-reports the pervasiveness of anti-Semitism in European thought, including the French Enlightenment. Bratton is at Whitworth College. (E&E)

Bratton, Susan Power. "The Ecotheology of James Watt." Environmental Ethics 5(1983):225-36. The popular press has claimed that (former) Secretary of the Interior James Watt bases his philosophy of environmental management on his religious views as a charismatic Christian. An examination of Watt's published statements indicates: (1) his philosophy of environmental management stems largely from economic and political considerations; (2) he has a relatively simple ecotheology based on concepts such as God providing creation as a blessing for mankind, and mankind having a stewardship responsibility to use resources to provide for people; (3) his ecotheology does not incorporate any characteristically charismatic ideas; and (4) his ecotheology does not strongly parallel that of conservative Christian theologians who have written on environmental issues. This analysis suggests that for the new "Christian politic" as a whole, there is a danger of confusing the scriptural with the cultural and political in the area of environmental ethics. If a Christian ecotheology is going to be used for environmental decision making, it should be developed fully and represent scripture accurately and completely. Bratton is at the

Institute of Ecology, University of Georgia, Athens, GA. (EE)

Bratton, Susan Power. "National Park Management and Values." Environmental Ethics 7(1985):117-33. Throughout the history of the U.S. national park system, park advocates and managers have changed both acquisition priorities and internal management policies. The park movement began with the establishment of large, spectacular natural areas, primarily in the West. As the movement developed there was more emphasis on the biological, on recreation, and on parks near population centers. Gradually, scenic wonders and uniqueness have become less necessary to designation and the types of sites eligible have diversified. Early managers treated the parks as relatively unchanging, threatened by little other than human vandalism. Initially managers removed "bad" animals, such as wolves, and suppressed disturbances, such as fire. Modern management values processes as well as objects and recognizes change and disturbance as integral to park maintenance. A conversion to an ecosystem mode of management does not answer all questions concerning values, however, and may present some disadvantages, such as a tendency to treat nature as a series of functions and energy equations, thus weakening aesthetic values. Bratton is at the Institute of Ecology, University of Georgia, Athens, GA. (EE)

Bratton, Susan Power. "Lopsided Justice and Eco-Realities for Women." CTNS (Center for Theology and Natural Science) Bulletin 16, no. 2 (Spring 1996): 18-27. Women's overall low status in the public sphere has limited their environmental representation. Environmental strategies must improve women's ability to participate in political and economic decision-making. We need some careful thinking by both women and men concerning ways in which we can develop more woman-inclusive environmental strategies. Breed, Allen, "Blocking of waterways prompts ownership debate," The Charleston Post and Courier (5/31/98): B7. Who owns the waterways? With millions turning to nature for recreation and as developers move deeper into the woods to build second homes, conflicts between private property rights and river access and use are increasing. In Arkansas, a farmer has strung barbed wire across a creek known for its excellent smallmouth-bass fishery. In Colorado, a landowner's plan to build a low bridge across the Taylor river seems an attempt to force travelers to trespass on shore. A New York State Court of Appeals has ruled that a private landowner holds the exclusive fishery rights on the Salmon River near Syracuse, even though the fish were stocked by the state. Laws vary from state to state and may depend on the stream. In some states, you can float a "privately owned" stream but trespass if you push off the bottom or anchor your boat. Some landowners' titles contain "kings grants" to exclusive rights to the flowing water. River users point to the Magna Carta as a basis for the public's right to use rivers. In the 13th Century, the exclusion of the public from England's forests and streams helped prompt the Magna Carta, which includes the right to a free fishery and the liberty of navigation. (v9,#2)

There is "potential in environmental studies for the renewal of the educational process." Humans think and orient themselves in the world using "frameworks of ideas." "We can think of the goal of education for eco-literacy as posing a challenge to be met in more or less grand ways. In a minimal way, we can think of exploiting the frameworks familiar to students in the various academic disciplines in order to provide them with some degree of environmental awareness." "A grander proposal

for making eco-literacy more widespread [is that] we can perhaps best break way from modes of thought that draw on only one or two frameworks by providing transdisciplinary units and degree programs which encourage multi-framework thinking. Examples of these include degree programmes in human ecology, drawing upon the disciplines of various sciences as well as philosophy, politics and international law. If we can produce enough graduates to whom such thinking is natural, then there is some chance that a wider range of responses to our environmental problems will be forthcoming." Brennan was formerly in philosophy at the University of Stirling; he is now at the University of Western Australia, Perth. (v2,#1)

Brennan, Andrew, "Beyond the Social Contract", in M. Redclift and G. Woodgate, eds., The Sociology of the Environment. Edward Elgar, 1994. A reprint of chapter 12 of Brennan's Thinking About Nature.

Brennan, Andrew, ed., The Ethics of the Environment, in The International Research Library of Philosophy. 500 pages. Hardcover. \$ 134.95. Aldershot, Hampshire, U.K.: Dartmouth Publishing Co., forthcoming, spring 1994. U.S. Distributor: Ashgate Publishing Co., Old Post Road, Brookfield, VT 05036. Brennan is professor of philosophy, University of Western Australia. More on this in due course. (v4,#2)

Brennan, Andrew, "Poverty, Puritanism and Environmental Conflict," Environmental Values 7(1998): 305-331. The paper proposes two ideas: (1) The wilderness preservation movement has failed to identify key elements involved in situations of environmental conflict. (2) The same movement seems unaware of its location within a tradition which is both elitist and Puritan. Holmes Rolston's recent work on the apparent conflict between feeding people and saving nature appears to exemplify the two points. With respect to point (1), Rolston's treatment fails to address the institutional and structural features which set the agenda for individual human lives. The human ecology of environmental destruction cannot ignore the role of corporate actors such as banks, national governments, transnational corporations, trade unions and so on. These agents interact with each other in various ways and also have an internal structure - perhaps akin to Arthur Koestler's conception of the holarchy - which enables people working within them to avoid taking responsibility for policies that have damaging environmental consequences. As far as thesis (2) is concerned, Rolston's work shares common features with Arne Naess's deep ecology and Aldo Leopold's land ethic. All of these writers draw, perhaps unconsciously, on a tradition of sporting elitism associated with the Great White Hunter. One variety of this tradition combines elitism with a form of Puritanism. KEYWORDS: environmental conflict, Puritanism, poverty, elitism, human ecology, Rolston. Andrew Brennan is at The University of Western Australia. Perth. (EV)

Earth Summit Ethics: Toward a Reconstructive Postmodern Philosophy of Environmental Education. Albany, NY: State University of New York Press, 1996. (v7, #3)

Brennan, Andrew, Thinking About Nature: An Investigation of Nature, Value and Ecology. Athens, GA: The University of Georgia Press, 1988. PP. xiii, 235. This is a careful argument in defense of what the

author terms "ecological humanism." Ecological humanism is an environmental holism based on an ecological re-interpretation of human nature, without questionable metaphysical assumptions or value claims about systems, collections, or aggregates. In the first half of the book, Brennan discusses epistemological frameworks, the philosophy of science, reduction and holism, functions, and ecological theory, to arrive at the apparently simple core idea: "what something is and does depends in part on where it is" (p. 117). This "ecological" perspective reveals that objects are constituted by a combination of their internal properties and their external relationships.

Ecological theory thus permits a thoroughgoing critique of contemporary moral theory. Utilitarianism, Kantianism, and contract theory all ignore "the ecological facts of life." They assume that value or good can be defined in some abstract way without a regard to context: ecological, natural, social, political, and economic (p. 174, and Chaps. 11 and 12). Ecological humanism creates a theory of value and a system of ethics based on the way humans actually live in a natural and social world: "it involves the recognition that all human life is lived within some natural context and that it is in terms of that context that the identities of very different human lives are forged" (p. 184). The strength of this book is the blending of several disciplines of philosophy and science. Brennan shows by his practice that environmental philosophy is not a marginal enterprise, but a necessary component of any meaningful epistemology, metaphysics, or ethics. In the process, he offers solutions to several puzzles about human and natural value that have plagued environmental ethics. The book ends with an excellent summary of practical policy proposals. (Katz, Bibl # 2)
Reviewed in Environmental Ethics 11(1989):259-67.

Brennan, Andrew A., "Ecological Theory and Value in Nature," Philosophical Inquiry 8, nos. 1-2 (Winter-Spring 1986):66-95. Certain current ecological theories do not support the Deep Ecologist intuition that ecosystems are "superindividual organisms." Brennan thus suggests that a community theory of ecosystemic structure "will most plausibly capture the moral insights urged by deep ecologists." (p. 89). (Katz, Bibl # 1)

Brennan, Andrew, "Environmental Decision-Making," in R.J. Berry volume, Environmental Dilemmas: Ethics and Decisions (London: Chapman and Hall, 1993), 271 pages. A widespread, puzzling phenomenon underlies our inability to tackle environmental issues. This is the plight of those who are "incontinent" in Aristotle's term. Recent philosophy recognizes self-deception and bad faith as a widespread human failing. We are a long way, in governments, public agencies, and corporations, from full honesty in our debates on the environment. To make progress in tackling our increasingly desperate environmental plight we have to make strenuous efforts to overcome our myth-making and ready acceptance of partial, shallow versions of the truth. Many of those who regard themselves as morally deep fall foul of such shallowness. Brennan reaches in net result a blend of pessimism and qualified optimism. We are always going to be prone to self-deception and incontinence, deep seated and largely unchanging aspects of human life, but there is nothing equally inevitable about shallow and mythic thinking. These failings can be identified now and guarded against. (v4,#1)

Brennan, Andrew and Lo, Yeuk-Sze, "Environmental Ethics," in Stanford Encyclopedia of Philosophy. Online at <http://plato.stanford.edu/entries/ethics-environmental/>
Introductory article, suitable for use with students. Environmental ethics is the discipline that studies the moral relationship of human beings to, and also the value and moral status of, the environment and its nonhuman contents. This entry covers (1) the challenge of environmental ethics to the anthropocentrism (i.e. human-centeredness) embedded in traditional western ethical thinking; (2) the early development of the discipline in the 1960's and 1970's, (3) the connection of deep ecology, feminist environmental ethics, and social ecology to politics, (4) the attempt to apply traditional ethical theories, including consequentialism, deontology, and virtue ethics, to support contemporary environmental concerns, and (5) the focus of environmental literature on wilderness, and possible future developments of the discipline. Brennan is at the University of Western Australia, Perth. (v.13, #3)

Brennan, Andrew, "Ethics, Ecology, and Economics," Biodiversity and Conservation 4(1995):798-811. Also in Cooper, Nigel and Carling, R.C.J., eds., Ecologists and Ethical Judgments. London: Chapman and Hall, 1996. The general structure of an environmental philosophy. There can be many such philosophies, and those with their roots in economic theory have been extensively studied recently. Specific examples include the work of David Pearce and Robert Goodin. Economics-based philosophies can founder on the issue of externalities and a misplaced attempt to provide a comprehensive approach to valuing nature as a bundle of goods and services. It is dangerously easy to slide from considering nature as a standing reserve of processes and objects that have the potential to satisfy human desires to the idea that it is nothing more than that. In general, the consequentialist basis of economics limits its usefulness in contributing to informed environmental decisions. But there is room for a sensitive use of institutional environmental economics as a partial guide for our reflections and choices. Any such development should take on board the existence of a plurality of perspectives on fundamental issues and the pluralism of values that can be found within moral theory itself. Brennan is in philosophy at the University of Western Australia, Perth.

Brennan, Andrew, "Moral Pluralism and the Environment." Environmental Values Vol.1 No.1(1992):15-34. ABSTRACT: Cost-benefit analysis makes the assumption that everything from consumer goods to endangered species may in principle be given a value by which its worth can be compared with that of anything else, even though the actual measurement of such value may be difficult in practice. The assumption is shown to fail, even in simple cases, and the analysis to be incapable of taking into account the transformative value of new experiences. Several kinds of value are identified, by no means all commensurable with one another--a situation with which both economics and contemporary ethical theory must come to terms. A radical moral pluralism is recommended as in no way incompatible with the requirements of rationality, which allows that the business of living decently involves many kinds of principles and various sorts of responsibilities. In environmental ethics, pluralism offers the hope of reconciling various rival theories even if none of them is universally applicable. KEYWORDS: Cost-benefit analysis, pluralism, preferences, rationality, transformative values. Philosophy Department, University of Western Australia, Nedlands, Perth, WA 6009 Australia.

Brennan, Andrew, "Environmental Ethics," in Routledge Encyclopedia of Philosophy, 10 vols, ed, Edward Craig (London: Routledge, 1998) in vol. 3, pp. 333-336. Brennan is in philosophy, University of Western Australia, Perth. (v.13,#1)

Brennan, Andrew, ed., The Ethics of the Environment. Aldershot, Hampshire, U.K.: Dartmouth Publishing Co., 1995. 583 pages. U. S. Distributor: Ashgate Publishing Co., Old Post Road, Brookfield, VT 05036. 802/276-3162. Hardcover, \$ 149.95. Unlike most other anthologies, this collection is aimed at the research level rather than the introductory one. Brennan has written an introduction which summarizes the intellectual and philosophical problems facing environmental philosophy and supplies a select bibliography. The collection, which looks like a hefty legal volume, is designed mainly for library purchase, and is part of a larger series: The International Research Library of Philosophy. Though expensive, it provides a complete introduction to the original academic literature. Academics may wish to request their librarians to get it. In keeping with the policy of the series, papers are included only if they originally appeared in academic journals. One useful feature of the volume is that the papers are not re-typeset but reprinted as photocopied in their original form, unabridged and including the original journal pagination. Another feature is that essays are grouped together so that subsequent ones comment directly on earlier ones. As a result readers can follow an emerging dialogue. The volume contains 33 papers organized in the following sections: Intrinsic Value and Moral Standing, with papers by P. Taylor, G. H. Paske, A. Brennan, J. O'Neill. Species, Ecosystems and Interests, with papers by H. Rolston, G. Varner and H. Cahen. Deep Ecology and Radical Environmentalism, with papers by A. Naess, F. Mathews, P. Reed, T. Birch, R. Guha and D. M. Johns. Ecology and Feminism, with papers by V. Plumwood, J. Cheney, K. Warren and A. K. Salleh. Are Humans Part of Nature or Separate From It?,

with papers by H. Rolston, M. Smith, A. Gunn, J. B. Callicott. Policy Dilemmas and Pluralism, with papers by M. Sagoff, K. Shrader-Frechette, B. Norton, C. D. Stone, J. B. Callicott and A. Brennan. Brennan teaches philosophy at the University of Western Australia. (v6,#4)

Brennan, Andrew, "Environmental Literacy and Educational Ideal." Environmental Values 3(1994):3-16. Environmental literacy is not encouraged by discipline-based education. Discipline-based education is damaging not only because it breaks the link between experience and theory but also because it encourages learners to believe that complex practical problems can be solved using the resources of just one or two specialist disciplines or frameworks of thought. It is argued that discipline-based education has been extremely successful, and its very success is a factor which explains some of our poor thinking about environmental problems. These problems are highly complex, and it is important for learners to discover the limitations of particularly important in the case of economics. An education which emphasizes the limitations of specialist approaches to complex problems can also be used to help overcome the depersonalizing effect of bureaucracies. KEYWORDS: Environmental literacy, frameworks, education, ecology, Dewey, Freire, economics, liberal education, Hirst, bureaucracy. Brennan is with Dept. of Philosophy, University of Western Australia, Perth. (EV)

Brennan, Andrew, "Environmental Ethics," in Craig, Edward, ed., Routledge Encyclopedia of Philosophy, 10 vols. (London: Routledge, 1998), in vol. 3, pages 333-336. Also available on CD. This competent article introducing the field in this major, ten-volume encyclopedia, effectively replacing the old five-volume Edwards Encyclopedia of Philosophy is a welcome addition to the literature, and recognizes that environmental ethics has become an established discipline within philosophy. Brennan is in philosophy at the University of Western Australia, Perth. (The set is expensive, about £2,000 with the CD, so your college and university librarians may need some encouragement to purchase it.)

Brennan, Andrew, "The Moral Standing of Natural Objects," Environmental Ethics 6(1984):35-56. Perhaps the most significant paper in recent years. Brennan offers an original candidate for the source of "moral considerability" or "intrinsic value" in natural entities: natural entities lack an "intrinsic function"; they were not designed for a purpose. It is that lack of design which distinguishes them from man-made artifacts. Brennan uses this concept to show the difference in moral attitude towards natural objects and art objects. The end of this essay begins to tackle some of the problems of holism, but the work is left undone: do whole groups, such as families or ecosystems, lack an intrinsic function? If so, then these deserve moral consideration over and above the individuals that comprise them. (Katz, Bibl # 1)

Brennan, Andrew. "The Moral Standing of Natural Objects." Environmental Ethics 6(1984):35-56. Human beings are, as far as we know, the only animals to have moral concerns and to adopt moralities, but it would be a mistake to be misled by this fact into thinking that humans are also the only proper objects of moral consideration. I argue that we ought to allow even nonliving things a significant moral

status, thus denying the conclusion of much contemporary moral thinking. First, I consider the possibility of giving moral consideration to nonliving things. Second, I put forward grounds which justify this extension of morality beyond its conventional boundaries. Third, I argue that natural objects have a status different from a special class of artifacts--works of art. Fourth, I discuss the notion of interest, and fifth I look briefly at the status of natural systems and at ways we might link the proposed extension of moral considerability with the rest of our moral thinking. Brennan is at the Philosophy Dept., University of Stirling, Stirling, Scotland, UK. (EE)

Brennan, Andrew. University of Stirling, Scotland, has collaborated with Sean Smith of St. Andrews University, Scotland, to produce a comprehensive 45 page bibliography of the last twenty years of environmental ethics. Three separate publications are: Anthony Ellis, Ethics for Environmentalists; Andrew Brennan, Environmental Philosophy; and Andrew Brennan, Bibliography of Recent Work in Environmental Ethics. They are available from The Centre for Philosophy and Public Affairs, University of St. Andrews, KY16 9AL, Scotland. (v1,#1)

Brennan, Jason, "Dominating Nature," *Environmental Values* 16(2007): 513-528. Something is wrong with the desire to dominate nature. In this paper, I explain both the causes and solution to anti-environmental attitudes within the framework of Hegel's master-slave dialectic. I argue that the master-slave dialectic (interpreted as a metaphor, rather than literally) can provide reasons against taking an attitude of domination, and instead gives reasons to seek to be worthy of respect from nature, though nature cannot, of course, respect us. I then discuss what the social and economic conditions of moving to a post-domination philosophy appear to be. Brennan is in political science, Brown University, Providence, Rhode Island.

Briggs, John M. et al., "An Ecosystem in Transition: Causes and Consequences of the Conversion of Mesic Grassland to Shrubland," BioScience 55(no.3, March 2005):243-255(13). Woody plant expansion is one of the greatest contemporary threats to mesic grasslands of the central United States. In this article, we synthesize more than 20 years of research to elucidate the causes and consequences of the ongoing transition of C4-dominated grasslands to savanna-like ecosystems codominated by grasses and woody plants. This transition is contingent on fire-free intervals, which provide the opportunity for recruitment both of new individuals and of additional shrub and tree species into this grassland. Once shrubs establish, their cover increases regardless of fire frequency, and infrequent fires accelerate the spread of some shrub species. This process has resulted in a new dynamic state of shrub-grass coexistence in the mesic grasslands of North America. Important consequences of this shift in plant life-form abundance include alterations in plant productivity, species diversity, and carbon storage. Without drastic measures such as mechanical removal of shrubs, it is unlikely that management of fire and grazing regimes alone will be sufficient to restore historic grass dominance in these ecosystems.

Briggs, Robert. "Wild Thoughts: A Deconstructive Environmental Ethics?" Environmental Ethics 23(2001):115-134. Although environmental ethics has become more familiar and comfortable with the work of postmodernism, "deconstruction" in particular continues to be depicted as "destructive" and "nihilistic." A close examination of some specific works of deconstruction, however, shows that, far from denying responsibilities to the environment, deconstruction seeks to affirm a radical obligation toward the "other." Because this possibility is habitually ruled out by denunciations of deconstruction's imputed relativism, I begin with a dramatized account of the possible reception of deconstruction within environmental ethics in order to stage the ethical implications of modes of criticism. I then discuss specific parallels between the work of deconstruction and that of environmental ethics, and suggest that a deconstructive spirit is at the heart of environmental philosophy's recent and most important work on the question of "universal consideration." Brinkmann, Klaus, ed., Ethics: The Proceedings of the Twentieth World Congress of Philosophy, vol. 1 (Bowling Green Ohio: Philosophy Documentation Center, 1999). Note the extent to which environmental ethics is quite well represented in this, the first of twelve World Congress volumes. Contains:

--Attfield, Robin, "Depth, Trusteeship, and Redistribution," pages 159-168. I review some themes of Naess's "The Shallow and the Deep, Long-Range Ecology Movements" article and Routley's "Is There a Need for a New, An Environmental Ethic" presentation at the 1973 World Congress. Naess's affiliation to the Deep Ecology Movement deserves acclaim, theoretic entanglements notwithstanding. Routley advocated a new ethic because no Judaeo-Christian ethical tradition could cope with widespread environmental intuitions. However, the ethical tradition of stewardship can satisfy such concerns. It is compatible with environmental values, need not be managerial, and can assume a secular form. But the related responsibilities vary with wealth and power, and structural change is necessary to empower people currently unable to uphold it. Attfield is in philosophy at the University of Wales, Cardiff.

--Rolston, Holmes, III, "Nature and Culture in Environmental Ethics," Pages 151-158. The pivotal claim in environmental ethics is that humans in their cultures are out of sustainable relationships to the natural environments compromising the landscapes on which these cultures are superimposed. But bringing such culture into more intelligent relationships with the natural world requires not so much "naturalizing culture" as discriminating recognition of the radical differences between nature and culture, on the basis of which a dialectical ethic of complementarity may be possible. How far nature can and ought be managed and be transformed into humanized nature, resulting in "the end of nature," is a provocative question. Environmental ethics ought also to seek nature as an end in itself. Rolston is in philosophy at Colorado State University.

--Passmore, John, "Philosophy and Ecology," pages 141-150. There was a time when ecological problems were of no interest to philosophy. Now, these issues have raised philosophical problems in several areas. In moral philosophy, one question is what moral obligations, if any, we have to future generations, and another is how far we have moral obligations relating to the treatment and the preservation of plants, animals and atmospheres. In political philosophy, the issue is the range of such concepts as rights and justice, and whether or not they are limited to human relationships. As to the metaphysical question, we have to ask whether there is something about human beings which entitles us to consider them as being supernatural and whether we can think of Nature as an entity of which each human being constitutes a part. Passmore is in the Historical Studies Department, Australian National University, Canberra.

--Häyry, Matt and Takala, Tuija, "Biotechnology and the Environment: From Moral Objections to Ethical Analysis," pages 169-178. Rights can be founded in a variety of ethical systems--e.g. on natural law, on the duties postulated by deontological ethics, and on the consequences of our actions. The concept of risk we will outline supports a theory of rights which provides at least individual human beings with the entitlement not to be harmed by the environmental impacts of biotechnology. The analysis can, we believe, also be extended to the rights of animals as well as ecosystems, both of which can be harmed by human actions. We argue that further examination of these harms and rights would be the best way to proceed from emotional moral objections to truly ethical analyses in the context of biotechnology and the environment. Häyry and Takala are in philosophy, University of Helsinki.

--Skirbekk, Gunnar, "Discourse-Ethical Gradualism: Beyond Anthropocentrism and Biocentrism?," pages 95-106. My question is the following: to what extent is ethical anthropocentrism tenable? In a "discourse ethical" perspective I will consider some case-oriented arguments in favor of a paradigmatically unique ethical standing for humans and some arguments in favor of an ethical gradualism between humans and other mammals and between humans and nature, ending with a conclusion in favor of a fair treatment of all moral subjects, human and non-human. Skirbekk is in philosophy, University of Bergen, Norway. (v.10,#3)

Brito, Daniel, "Lack of Adequate Taxonomic Knowledge May Hinder Endemic Mammal Conservation in the Brazilian Atlantic Forest," Biodiversity and Conservation 13(2004):2135-2144. The Atlantic Forest in Brazil is a biodiversity hotspot, and we do not know taxonomically even the charismatic megafauna in it. New species are discovered, described and taxonomically rearranged at an astounding rate. Brito is a Brazilian ecologist, Universidade Federal de Minas Gerais.

Brittan, Jr., Gordon G., "Wind, energy, landscape: reconciling nature and technology," Philosophy and Geography 4 (No. 2, 2001): 169-184. Despite the fact that they are in most respects environmentally benign, electricity-generating wind turbines frequently encounter a great deal of resistance. Much of this resistance is aesthetic in character; wind turbines somehow do not "fit" in the landscape. On one (classical) view, landscapes are beautiful to the extent that they are "scenic", well-balanced compositions. But wind turbines introduce a discordant note, they are out of "scale". On another (ecological) view, landscapes are beautiful if their various elements form a stable and integrated organic whole. But wind turbines are difficult to integrate into the biotic community; at least in certain respects, they are like "weeds". Moreover, there is a reason why the 100-meter, three bladed wind turbines now favored by the industry cannot very well be accommodated to any landscape view. They are, as Albert Borgmann would put it, characteristic of contemporary technology, distanced "devices" for the production of a commodity rather than "things" with which one can engage. It follows that the only way in which the aesthetic resistance to wind turbines can be overcome is to make them more "thing-like". One such "thing-like" turbine is discussed. Brittan is Regent's Professor of Philosophy at Montana State University. (P&G)

Brittan, Jr., Gordon G., "The Secrets of Antelope," Erkenntnis 51(1999):59-77. Daniel Dennett claims, in Consciousness Explained: "Antelope, in their herds, have no secrets and no way of getting any. So an antelope is probably no more capable of hatching a secret plan than it is capable of counting to a hundred or enjoying the colors of a sunset." Brittan replies: "I am not at all sure what the qualification 'in their herds' is supposed to entail. Otherwise, it is simply false that antelope (at least the American antelope or pronghorns) have no secrets, as I can attest on the basis of watching them very carefully over the past 25 years." A doe, for example, keeps it secret where her fawns is hidden. When he is not watching antelope, figuring out their secrets, Brittan is professor of philosophy at Montana State University. This is a theme issue of Erkenntnis on "Animal Minds." (v10,#4)

Britten, Hugh B., Peter F. Brussard, and Dennis D. Murphy, "The Pending Extinction of the Uncompahgre Fritillary Butterfly," Conservation Biology 8(1994):86-94. Found only on two Colorado alpine peaks, the species has low genetic variability, and persistent drought conditions in the 1980's have brought further decline. Human disturbance has been a factor, but probably not the critical factor. See comment in issues section below. Britten is in biology at Montana State University, Brussard is in biology at the University of Nevada-Reno, and Murphy is at the Center for Conservation Biology at Stanford University. (v5,#1)

Broad, Robin and John Cavanagh. Plundering Paradise: People, Power and the Struggle for the Environment in the Philippines. Berkeley: University of California Press, 1994. 197 pages. \$25.00. The Philippine Islands are one of the most advanced scenes of ecological degradation in the tropical world today. The causes are a global economy, foreign interests that use Filipino elites for their own interests. Operating through one of the most repressive political and military systems in Asia, they have generated mass poverty on a scale that is a major contributor to the downward environmental spiral. Yet grass-roots environmental protest movements have arisen, social movements emerging involving mass-based organizations of the political left, church activists, environmentalists, and NGOs. Northern environmentalists need to realize that environmental degradation in the tropics is primarily rooted in social exploitation, and that the exploited are a major source of hope and potential alliance for those who care both about conservation and people. A readable account of local activism and development in the post-Marcos, post-Cold-War nation. (v5,#2)

Brock, Gillian, "Future Generations, Natural Resources, and Property Rights," Ethics and the Environment 3(1998):119-130. In an important recent article, "Contemporary Property Rights, Lockean Provisos, and the Interests of Future Generations," Clark Wolf argues that sometimes the interests of future generations should take precedence over the claims of current property rights holders. Wolf's arguments concentrate on the genesis and nature of defensible property rights in various natural resources, and on the conditions under which morally unacceptable harm is caused to others.

In this paper I explore two central sets of issues. First, I investigate how the argument holds up when labor is involved in discovering, developing or preparing natural resources for appropriation. I consider some persuasive reasons why one might think Wolf's arguments lose force in such cases. I also indicate how to accommodate these concerns without diminishing the force of Wolf's main arguments. Second, I show how either the examples Wolf uses do not support the conclusion he is pressing, or the argument has extremely far-reaching implications. I argue that either of these conclusions is problematic for Wolf's argument as thus far developed. Brock is in philosophy, University of Auckland, Auckland, New Zealand. (E&E)

Brook, Isis, and Brady, Emily, "Topiary: Ethics and aesthetics," Ethics and the Environment 8(no. 1, 2003):127-143. We discuss ethical and aesthetic questions in relation to the gardening practice of topiary. We begin by considering the ethical concerns arising from the uneasiness some appreciators might feel when experiencing topiary as a manipulation or contortion of natural processes. We then turn to ways in which topiary might cause an 'aesthetic affront' through the humanizing effects of sentimentality and falsification of nature (most often found in representational rather than abstract topiary). Our contention is that successful topiary emerges through a dynamic and positive relationship between topiarist and tree, where the gardener works with nature's forms instead of in strong opposition to them. Appreciation of successful topiary, we shall argue, is marked by an experience of both the tree as a living thing and the artifice which has shaped it. The authors are at Lancaster University, UK. Brook, Isis, "Can Merleau-Ponty's Notion of 'Flesh' Inform or even Transform Environmental Thinking?" Environmental Values 14(2005): 353-362. Reference to Merleau-Ponty's ideas surfaces in environmental thinking from time to time. This paper examines whether, and in what way, his ideas could be helpful to that thinking. In order to arrive at a conclusion I examine in detail and attempt to clarify the notions of "Flesh" and "Earth" in order to see if they can carry the meanings that commentators sometimes attribute to them. With a clearer outline of what he was saying in place, I suggest that the new ontology that Merleau-Ponty introduces could help to transform environmental thinking, but that careful argumentation is required to show this. Brook is in environment, philosophy, and public policy, Lancaster University, UK. (EV)

Brook, Isis, "Wildness in the English Garden Tradition: A Reassessment of the Picturesque from Environmental Philosophy," *Ethics and the Environment* 13(no. 1, 2008):105-119. The picturesque is usually interpreted as an admiration of 'picture-like,' and thus inauthentic, nature. In contrast, this paper sets out an interpretation that is more in accord with the contemporary love of wildness. This paper will briefly cover some garden history in order to contextualize the discussion and proceed by reassessing the picturesque through the eighteenth century works of Price and Watelet. It will then identify six themes in their work (variety, intricacy, engagement, time, chance, and transition) and show that, far from forcing a 'picture-like' stereotype on nature, the picturesque guided the way for a new appreciation of wildness—one that resonates with contemporary environmental philosophy. Isis Brook is senior lecturer in ethics at the Centre for Professional Ethics, University of Central Lancashire, UK

Brooke, James, "Bigger and Bolder Population of Bears Incites Fear in Japan," New York Times, November 7, 2004, p. 15. More than 90 persons have been injured since April by a newly aggressive population of bears in northern Japan. The bear population has been expanding in numbers in a region with a shrinking human population, but a record number of typhoons has ruined the acorn harvest, other

food supplies are also not available, and the hungry bears have turned to finding food in the villages. (v.14, #4)

Brooke, James, "U.S. Hopes to Buy Picture-Perfect Slice of the West," New York Times, August 25, 1998, A1, A14. Baca Ranch Purchase. Biggest in a quarter century. The U.S. Forest Service and the U.S. Congress have moved closer to buying 95,000 acres of land in New Mexico, a ranch so emblematic of the U.S. West that it has served as a backdrop for Marlboro and Stetson hat ads. It is also the largest such tract of land near major cities, in this case Albuquerque and Santa Fe. The ranch is surrounded by Santa Fe National Forest. The ranch has 7,000 elk and 3,000 cows. (v.9,#3)

Brooke, James, "In the Balance, the Future of a Lake," New York Times (9/22/97): A10. Should Lake Powell be drained? Lake Powell is a 100-miles long lake that straddles the Utah/Arizona border and is formed by the Glen Canyon Dam on the Colorado River. When David Brower, a grandfather of the modern American environmental movement, proposed last year to drain Lake Power, few people took him seriously. Brower has felt guilty for 40 years for dropping opposition to the Glen Canyon Dam as a tradeoff that helped prevent construction of a dam that would have flooded Dinosaur National Monument in Colorado. With unanimous support from the Sierra Club Board of Directors and with backing from a Utah environmental group, the proposal to drain the nation's second largest artificial lake is now getting significant public attention. Utah politicians held Congressional hearings on the proposal in an attempt to embarrass its proponents.

The arguments against removing the dam are strong: Four million people use electricity generated from the dam; the dam provides flood control; the surrounding recreation area is the second most popular camping spot in the nation; 400,000 boats are launched on the lake ever year; draining the lake would create a massive environmental mess including odor from millions of rotting fish and a bathtub ring around the redrock shoreline. Those in favor of restoring Glen Canyon argue that the lake causes an 8 percent loss of water through evaporation and seepage into the ground (water whose value is estimated to be \$360 million a year). They point out that dams do not last forever and that eventually the lake will fill with silt. (An engineer who manages the dam claims that dredging will be needed to clear the turbine intake pipes in about 500 years.) The cold water that flows from the 500-foot deep lake, at 47 degrees, is also endangering several warm-water species of fish.

A restored Glen Canyon would support significant recreation and employment opportunities. While many find the lake quite beautiful, Edward Abbey once wrote that "the difference between the present reservoir, with its silent sterile shores and debris-choked side canyons, and the original Glen Canyon, is the difference between death and life. Glen Canyon was alive. Lake Powell is a graveyard." A former commissioner of the Federal Bureau of Reclamation (which built and operates the dam) argues that "Building a dam is the same as constructing a nuclear plant; you get immediate benefits, but you also get huge long-term costs. And a dam, just like a nuclear plant, can leave a legacy of environmental destruction that can take generations to correct." Although drainage of Lake Powell is unlikely, Congress has already agreed to pay to remove two dams on the Elwha River in Washington State to restore a salmon fishery. For other stories see Daniel P. Beard, "Dams Aren't Forever," New York Times (10/6/97): A17. Brad Knickerbocker, "Turning Man-Made Creations Back to Nature," Christian Science Monitor 89 (26 September 1997): 1, 5. (v8,#3)

Brookes, Graham, and Peter Barfoot, "GM Crops: The Global Economic and Environmental Impact--The First Nine Years 1996-2004," AgBioForum 8(nos. 2& 3, 2005):187-196. GM crops have been regularly commercially planted for about a decade. This study finds great economic benefits, largely from reduced pesticide use, since the GM crops are resistant to pests and do not need so much pesticide. This also results in reduced use of fossil fuels, reduced carbon dioxide emissions, and more carbon sequestered in

the soil (since there is less need for plowing). The study also finds a much reduced environmental footprint, since the reduced pesticide use means less pesticide spilling off the fields into the rivers, less adverse effects on birds and other wildlife. GM crops tend to keep the nearby ecosystems healthier than was formerly the case with heavy pesticide use. The authors are with PG Economics Ltd., Dorchester, UK.

Brooks, Daniel R. and Deborah A. McLennan, Parascript: Parasites and the Language of Evolution. Washington, DC: Smithsonian Institution Press, 1993. 450 pages. \$ 25.00 paper. The relationship between parasite and host is homologous to that between animal and plant. The many traditional generalizations about parasite evolution are myths, unsupported by data. "Parasites are not the degenerate, overspecialized, host-dependent creatures ... envisioned by the proponents of orthogenesis. They are instead successful, innovative creatures" (p. 181). "Parasites are still an enigma. But ... they need no longer carry an evolutionary stigma" (p. 209). The authors are in the department of zoology at the University of Toronto. (v4,#2)

Broom D. M. and Johnson K. G., Stress and Animal Welfare. New York: Chapman & Hall, 1993.

Broom, D.M., "A Usable Definition of Animal Welfare", Journal of Agricultural and Environmental Ethics 6(1993), Supplement. A definition of the welfare of an animal which can be used in scientific studies, legislation and other practical work is: the welfare of an individual is its state as regards its

attempts to cope with its environment. A variety of measurements can be used to pinpoint the individual's state on a continuum from very good to very poor welfare. Welfare can be poor because the individual is having difficulty in coping or because of failure to cope. Poor welfare includes stress, which is defined as an environmental effect on an individual which overtaxes its control systems and thus reduces its fitness or appears likely to do so. It also includes situations in which behavioural, physiological or immunological measures indicate that coping is difficult even if biological fitness is not reduced. Suffering is an important aspect of poor welfare. While much of poor welfare involves suffering, examples are given of situations in which welfare is poor in the absence of suffering. If suffering occurs in addition to injury or immunosuppression, then welfare is even poorer. Scientific studies of welfare should include direct measures of poor welfare as well as measures of the strengths of preferences and aversions. Measurements should be carried out in an objective way and moral judgments about what is tolerable should be made afterwards. Brouwer, Roy, Neil Powe, R. Kerry Turner, Ian J. Bateman, and Ian H. Langford. "Public Attitudes to Contingent Valuation and Public Consultation." Environmental Values 8(1999):325-347. ABSTRACT: The use of cost-benefit analysis (CBA) in environmental decision-making and the contingent valuation (CV) technique as input into traditional CBA to elicit environmental values in monetary terms has

stimulated an extensive debate. Critics have questioned the appropriateness of both the method and the technique. Some alternative suggestions for the elicitation of environmental values are based on a social process of deliberation. However, just like traditional economic theory, these alternative approaches may be questioned on their implicit value judgements regarding the legitimacy of the social-political organisation of the process of value elicitation. Instead of making assumptions a priori, research efforts should be focused on the processes by which actual public attitudes and preferences towards the environment can best be elicited and fed into environmental or other public policy decision-making. In the study presented in this paper, support was found for both the individual WTP based approach and a participatory social deliberation approach to inform the environmental decision-making process, suggesting that a combination of both approaches is most appropriate. KEYWORDS: Contingent environmental valuation, focus groups, public consultation, public deliberation. Roy Brouwer, Neil Powe, R. Kerry Turner, Ian J. Bateman, and Ian H. Langford, Centre for Social and Economic Research on the Global Environment (CSERGE), School of Environmental Sciences, University of East Anglia, Norwich, NR4 7TJ, UK. (Corresponding author) (EV)

Browers, Michaelle L. "Jefferson's Land Ethic: Environmentalist Ideas in Notes on the State of Virginia." Environmental Ethics 21(1999):43-57. I articulate what I refer to as Jefferson's "land ethic," drawing primarily from his Notes on the State of Virginia. In the first section, I discuss Jefferson's conception of the intimate relationship between the natural and political constitution of America and his vindication of both. In the second section, I examine the centrality of the environment in Jefferson's political vision for America: a land-based republicanism. In the third section, I elaborate Jefferson's view as to the proper relationship between human beings and their environment by focusing on the form of nature to which he believes human beings most intimately relate: one's estate. Jefferson's understanding of the land draws from John Locke's theory of property, but whereas Locke's concept of property is closely associated with the economic values that facilitate human destruction of the environment, Jefferson's environmentalism focuses on the other side of the relation: the ways in which a particular nature--a climate, one's landholding, the New World in general--can influence human nature and politics. Brown, Donald A. "Ethics, Science, and Environmental Regulation." Environmental Ethics 9(1987):331-49. Because complex environmental problems are relegated to scientific experts, the ethical questions that are embedded in these problems are often hidden or distorted in scientific and administrative methodology and communication. The administrative process requires that facts and values be separated. Those values that cannot simply be ignored are usually translated into technical economic language and settled in terms of economic costs and benefits. Calls for regulatory reform--i.e., to reduce or eliminate environmental regulation create additional pressures on analysts that encourage them to focus on quantitative questions at the expense of qualitative ones. Distortion can also result from the use of standard risk assessment procedures and from the improper placement of burden of proof on government agencies. The greatest problem, nevertheless, is the narrow scientific training of technical experts which frequently leaves them unprepared to deal with the ethical and value issues in environmental public policy. Brown is in the department of Environmental Resources, Harrisburg, PA. (EE)

Brown, Donald A., "Ethics, Science, and Environmental Regulation," Environmental Ethics 9(1987):331-349. A good overview and analysis of the problems encountered by policymakers in environmental regulation and reform. The central conceptual problem is the separation of facts and values; the main practical problem is the lack of ethical training by the scientific experts involved in the decisionmaking process. (Katz, Bibl # 1)

Brown, Donald A., compiler, Proceedings of Interdisciplinary Conference held at the United Nations on the Ethical Dimensions of the United Nations Program on Environment and Development, Agenda 21. Camp Hill, PA: Earth Ethics Research Group, 1994. The conference was held January 13-14, 1994. 392 pages. Some thirty papers, typically short, always focused on the issues raised in Agenda 21, and often on the text of that document. Samples: Rodrigo G. Barahona, "Ethical Questions Embedded in Biodiversity Provisions of Agenda 21"; Thomas Heyd, "Agenda 21 and the Limits of Technological Rationality"; Naresh C. Singh, "Ethical Questions Embedded in the Nuclear Waste Disposal Provisions of Agenda 21"; and many more. Contact Donald A. Brown, 2915 Beverly Road, Camp Hill, PA 17011. Fax: 717-787-9379. Phone 717-787-9368. (v5,#3)

Brown, Donald A., John Lemons, and Gary E. Varner. "Congress, Consistency, and Environmental Law." Environmental Ethics 12(1990):311-27. In passing the National Environmental Policy Act of 1969 (NEPA), Congress committed the nation to an ethical principle of living in "productive and enjoyable harmony" with the natural environment. Thus understood, NEPA can be given either (1) a technology-forcing interpretation or (2) an intelligent decision-making interpretation. We argue that in its subsequent decision to site a high-level nuclear waste repository at Yucca Mountain, Nevada, Congress acted inconsistently with this principle under either interpretation. We conclude that for the foreseeable future,

the only way to handle the nation's nuclear wastes consistent with the environmental goal enunciated in NEPA is to leave them in temporary surface storage facilities, prohibit the licensing of any new nuclear power plants, and take all appropriate steps to reduce the nuclear weapons industry. Brown is in the department of Environmental Resources, Harrisburg, PA. Lemons is in the department of Life Sciences, University of New England, Biddeford, ME. Varner is in the philosophy department, Texas A & M University, College Station, TX. (EE)

Brown, Donald, A., American Heat: Ethical Problems with the United States' Response to Global Warming. Blue Ridge Summit, PA: Rowman and Littlefield, 2002. The U.S., once a leader in environmental policy, has often become the major barrier to protecting the world environment. An ethical focus on global environment matters is the key to achieving a globally acceptable solution. Brown is senior counsel on Sustainable Development for the Pennsylvania Department of Environmental Resources. (v.13,#1)

Brown, G. G., P. Reed, and C. C. Harris, "Testing a Place-Based Theory for Environmental Evaluation: An Alaska Case Study," Applied Geography 22(2002):49-76. Do people value landscapes more if their evaluation is based on a sense of place, especially if the landscape is near where they live? A study of the Chugach National Forest in Alaska. Ecosystem values are not uniformly distributed across the landscape, that is, not spatially random, and some spatial relationships exist between selected ecosystem values and point of residence (community). Brown is in Environmental Science, Alaska Pacific University. Reed is with USDA Forest Service, Chugach National Forest, Anchorage, AK. Harris is in Resource Recreation and Tourism, University of Idaho, Moscow, ID.

Brown, Gregory, and Reed, Patrick, "Validation of a Forest Values Typology for Use in National Forest Planning," Forest Science 46(no. 2, 2000):240-247. Public values for national forest lands are assumed to underlie preferences for actual forest use and to define the content for management. In a survey of Alaska residents, (1) respondents were able to identify with 13 distinct forest values based on a modified forest value topology developed by Holmes Rolston and James Coufal. (2) No obvious findings indicated that the 13 value types could be simplified. (3) Small, but statistically significant correlations were found between these values and attitudes toward logging and mining. (4) Forest values are modestly predictive of preferences for specific forest planning decisions. Brown is in Environmental Science, Alaska Pacific University, Anchorage. Reed is with Chugach National Forest, Anchorage. (v.13, #3)

Brown, James H. Macroecology. Chicago: University of Chicago Press, 1995. 270 pp. \$42.50 cloth, \$15.95 paper. Brown proposes a radical new research agenda designed to broaden the scope of ecology so that it can address questions on much larger spatial and temporal scales. Much ecological research is narrowly focused and experimental, providing detailed information that cannot be used to generalize from one ecological community or time period to another. Brown draws on data from many disciplines to create a much broader picture with greater potential for generalization.

Brown, Jennifer, ed., Environmental Threats: Perception, Analysis and Management. London: Belhaven

Press, 1989. 160 pages. Cloth. £ 39.00. Eight essays by British social theorists who study risk. Some of the arguments: Lay or public risk attitudes are as important and valuable as those who are experts. Expert risk assessment is a doubtful way to handle environmental threats that are highly uncertain. Technical experts ought to be more sensitive to the underlying uncertainties in risk assessment. Different social risk perceptions underlying the Sellafield controversy over nuclear risk. Social risks associated with biotechnology. The public is not irrational in its aversion to many environmental and technological risks; rather, there is a plurality of rationalities applicable to risk. Different types of uncertainties beset quantitative risk assessment and allow for various evaluations of environmental threats. "One of the most important contemporary volumes on the social aspects of risk" (Kristin Shrader-Frechette). (v4,#4)

Brown Jr., George E. "Environmental Science Under Siege in the U.S. Congress," Environment 39 (1997): 12. The prominent role given to skeptical science during the 104th Congress's reassessments of U.S. environmental regulation raises profound questions about the value of peer review and the role science and scientists play in the formulation of public policy. Focuses on Woburn, a community outside Boston, a bleak story of the dynamics of a citizens' struggle against corporate malfeasance. The authors are associated with Harvard Medical School. (v2,#1)

Brown, Rachel. "Righting Ecofeminist Ethics: The Scope and Use of Moral Entitlement." Environmental Ethics 26(2004):247-265. Rights have been criticized as incorporating features that are antithetical to ecofeminism: rights are allegedly inherently adversarial; they are based on a conception of the person that fails to reflect women's experience, biased in an illegitimate way toward humans rather than nonhumans, overly formal, and incapable of admitting the importance of emotion in ethics. Such criticisms are founded in misunderstandings of the ways in which rights operate and may be met by an adequate theory of rights. The notions of entitlement and immunity that flow from a conception of rights have great use and potential in environmental ethics. Nonetheless, our understanding of moral rights must be revised in order to realize this potential. The usual attribution of moral rights is structurally arbitrary because obligations arising from others' rights are unjustifiably distinguished from other sorts of obligations for which the same sorts of justificatory bases obtain. Once this arbitrariness is recognized, there remains little reason not to extend a continuous framework of entitlement toward nonhuman animals and nature more generally. Reassessing moral rights according to a basic principle of respect delivers an integrated account of our moral obligations toward one another, and a satisfactory basis from which to account for our diverse obligations toward nonhuman animals and the environment. Bruce, Donald M., "A Social Contract for Biotechnology: Shared Visions for Risky Technologies?" *Journal of Agricultural and Environmental Ethics* 15(no. 3, 2002):279-289. Future technological developments concerning food, agriculture, and the environment face a gulf of social legitimation from a skeptical public and media, in the wake of the crises of BSE, GM food, and foot and mouth disease in the UK (House of Lords, 2000). Key ethical issues were ignored by the bioindustry, regulators, and the Government, leaving a legacy of distrust. The paper examines agricultural biotechnology in terms of a social contract, whose conditions would have to be fulfilled to gain acceptance of novel applications. Various current and future GM applications are evaluated against these conditions. Success would depend critically on how far a shared vision can be found with the public. To re-establish trust, significant changes are identified in the planning and pursuit of biotechnology. KEY WORDS: accountability, biotechnology, consultation, consumer perceptions, control, environmental risk, ethics, genetic modification, GM animals, GM food, GM crops, nutraceuticals. policy. power, risk. safety, shared vision, social contract, trust, values. Bruce is with the Society, Religion and Technology Project, Church of Scotland, Edinburgh. (JAEE)

Bruce, Donald, "Finding a Balance over Precaution," *Journal of Agricultural and Environmental Ethics* 15(no. 1, 2002):7-16. Three interpretations of the precautionary principle are identified, namely "soft," "hard," and outright rejection. The EC Communication of February 2000 is largely a response to the latter, to provide a legitimation in trade-related WTO disputes. This context leads to an over stress on scientific closure. This is critiqued as idealistic in respect of resolving long term uncertainties inherent in the GM food issue. While offering some useful guidelines in risk management, the EC report seriously fails to take into account the ethical and societal dimension of risk. These are crucial both in determining when precautionary principle is invoked and the action to be taken. The EC view leans too much to a scientific rationalist risk perspective. However, the "Green" interpretation of the precautionary principle as a reversal of the burden of proof is also criticized as inconsistent both with the nature of technology and with the nature of reality as seen in a Christian perspective. Biblical insights on risk reveal a balance of intervention and conservation in a world where risk is inherent. The notion of risk as a social contract reveals that ethical and societal issues have a crucial role to play in applying the precautionary principle. KEY WORDS: Christianity, EC, Green, precautionary principle, risk assessment, social contract, WTO. Bruce is with the Society, Religion and Technology Project, Church of Scotland. (JAEE)

Bruce, Donald, and Bruce, Ann, eds., *Engineering Genesis: The Ethics of Genetic Engineering in Non-human Species*. London: Earthscan Publications, 1998. 337 pages. £12.99. Ethics under the Microscope. Chapter 4. Genetic Engineering and Animal Welfare. Chapter 5. Animal Ethics and Human Benefit. Chapter 6. Transgenic Food. Chapter 7. Letting Out the Genie: Environmental Risk and Regulation. Chapter 8. Patenting Life. Chapter 9. Genetic Engineering and Developing Countries. Chapter 10. The Social Context of Genetic Engineering. Chapter 11. Final Reflections. Donald Bruce is the Scientific Director, Society, Religion and Technology Project, Church of Scotland, Edinburgh. Ann Bruce was formerly an animal breeding specialist in the agricultural industry. Other contributors include: Michael Northcott, in Christian ethics, University of Edinburgh; Mike Appleby, lecturer in animal welfare,

University of Edinburgh. (v.10,#1)

Bruce, J.; Hoesung, Lee; and Haites, E. Climate Change 1995--Economic and Social Dimensions of Climate Change. New York: Cambridge University Press, 1996. 608 pages. \$74.95 cloth, \$29.95 paper. This is the contribution of Working Group III to the Second Assessment Report of the Intergovernmental Panel on Climate Change. This work addresses the costs of climate change, both in terms of society and equity issues, and the economic burden of combating adverse climate change. (v7, #3)

Bruch, Carl, Coker, Wole, and VanArsdale, Chris, Constitutional Environmental Law: Giving Force to Fundamental Principles in Africa. Washington, DC: Environmental Law Institute, 2000. (1616 P Street, N.W., Suite 200, Washington, DC 20036. 202/939-3800. Fax: 202/939-3868. E-mail: law@eli.org.) \$ 15. Many African countries, often with fairly recent constitutions, have explicit constitutional provisions guaranteeing a clean, healthy environment capable of sustaining human life. But enforcement is a problem, and opportunity. Three different traditions: common law, civil law, and Islamic law. Constitutional freedoms that facilitate environmental rights, such as freedom of association, access to information, and opportunities for public participation. Case studies. "Constitutional environmental provisions, including procedural guarantees, offer some of the best tools for environmental advocates."

Brueggemann, Walter. The Land: Place as Gift, Promise and Challenge in Biblical Faith. Philadelphia: Fortress Press, 1977.

Brueggemann, Robert, *Sprawl: A Compact History*. Chicago: University of Chicago Press, 2005. Sprawl is urban development, a largely beneficial expression of human desires that transcend geography and history. Sprawl should not be feared or cast in a negative light. Brueggemann is in urban planning at the University of Illinois at Chicago.

Bruggeman, Walter, Using God's Resources Wisely: Isaiah and Urban Possibility. Louisville, KY: Westminster/John Knox Press, 1993. 89 pages, paper. Six studies in the prophet Isaiah, addressed to a growing awareness of the environmental crisis and how it relates to social relations especially in urban settings. Isaiah's prophecies are an artistic-theological history of the city of Jerusalem a case study of urban environmental crisis that resulted from a lost sense of covenantal neighborliness. There are alarming parallels in today's urban crises. Ecological degradation, consumerism, and resource depletion are essentially urban problems, and urban power, anxiety, and greed reach into non-urban places to destroy the rural and wild places, as well as to undermine the city's own life support. Bruggeman teaches Old Testament at Columbia Theological Seminary, Decatur, Georgia. (v5,#4)

Bruner, Michael and Oelschlaeger, Max, "Rhetoric, Environmentalism and Environmental Ethics". Environmental Ethics 16(1994):377-396. The growth of environmental ethics as an academic discipline has not been accompanied by any cultural movement toward sustainability. Indices of ecological degradation steadily increase, and many of the legislative gains made during the 1970s have been lost during the Reagan-Bush anti-environmental revolution. This situation gives rise to questions about the efficacy of ecophilosophical discourse. We argue (1) that these setbacks reflect, on the one hand, the skillful use of rhetorical tools by anti-environmental factions and, on the other, the indifference (even hostility) of the ecophilosophical community toward rhetoric, (2) that since the linguistic turn in philosophy, no rigid line of demarcation can be maintained between rhetoric and philosophy, and (3) that rhetoric offers resources to the ecophilosophical community that increase its potential to effect change in society. Bruner is with the Dept. of Communication Studies, University of North Texas, Denton. Oelschlaeger is with the Dept. of Philosophy, University of North Texas, Denton. (EE)

Brunk, Conrad G., Lawrence Haworth, and Brenda Lee, Value Assumptions in Risk Assessment: A Case Study of the Alachlor Controversy. Waterloo, Ontario: Wilfred Laurier University Press, 1991. Increasing reliance by public policymakers on scientific advisors is motivated in part by an assumption that such advice can be value-free. This study, based on the alachlor pesticide case, shows that risk assessors were divided by the fact that they held differing values, not by differences concerning the purely empirical aspects of the risk assessment. The authors concludes that risk assessment is as much a normative as it is a scientific enterprise. (Thanks to Peter Miller). (v2,#4)

Brunk, Conrad, Lawrence Haworth, and Brenda Lee, "Is Scientific Assessment of Risk Possible? Value Assumptions in the Canadian Alachlor Controversy," Dialogue (Canadian Philosophical Review), 30 (no. 3, Summer 1991):235-248. The issue is devoted to applied ethics. (v3,#1)

Brunnschweiler, C.N., and E.H. Bulte. "Linking Natural Resources to Slow Growth and More Conflict." *Science* Vol. 320, no. 5876 (2 May 2008): 616-17. Although an abundance of natural resources was generally perceived as advantageous to development until the 1980s, in the 1990s natural resources were often considered a curse. Resource-rich economies often suffer from weak or autocratic leadership, failing institutions, exploitation by wealthier developed states, greedy leaders and rebels, but Brunnschweiler and Bulte claim that natural resources do not necessarily spell doom for development.

Bruno, John F., Stachowicz, John J., and Bertness, Mark D., "Inclusion of facilitation into ecological theory," Trends in Ecology and Evolution (TREE) 18(no. 3, 2003):119-125. A controversial push to focus on positive ecological interactions rather than competition and predation has ignited a debate among ecologists. A new group of ecologists argue that much of modern ecological theory stems from a misleading fixation on the roles of competition, predation, and externally imposed stress in shaping natural communities. Missing from core concepts, they argue, is the growing realization that species can interact in positive ways--a process called facilitation--with major consequences for community structure. See also: Shouse, Ben, "Conflict over Cooperation," Science 299(31 January 2003):644-646.

Bruno, Kenny and Karliner, Joshua, Earth Summit. biz: The Corporate Takeover of Sustainable Development. Oakland, CA: Foodfirst Books, Institute for Food and Development Policy, 2002. www.foodfirst.org. Phone 510-654-4400. How transnational corporations have coopted the rhetoric of social and environmental responsibility. But there are principles and structures within the United Nations with some potential to counter the World Trade Organization. Alas, however, with the unveiling of the Global Compact in 2000, the U.N. has given corporations the chance to declare their declaration to social and environmental responsibility without actually being held accountable for their actions. Brussard, Peter F., Dennis D. Murphy, and C. Richard Tracy. "Cattle and Conservation Biology--Another View." Conservation Biology 8 (1994): 919-921. More on a debate in this journal (September 1994, by Reed Noss, editor, and others) on cattle on public lands and the extent of their ecological degradation, mixed here with questions about the extent of advocacy legitimate to conservation biologists. The Society for Conservation Biology "differs from environmental advocacy groups because it promotes science rather than any partisan agenda. If the Society becomes too strident in advocating specific political prescriptions to preserve ecological systems, it may gamble away more than its credibility. It risks losing the opportunity to apply that mission within the broadest possible community of interests. The September 1994 issue of Conservation Biology takes us dangerously close to that state of affairs. ... We obviously can also contribute as activists, but this should be done outside our society." An interesting editorial quite suitable for use in classroom discussions of science and advocacy. Brussard, President of the Society for Conservation Biology, is in biology at the University of Nevada/Reno; Murphy, President-Elect, is in biology at Stanford University, and Tracy is in biology at Colorado State University. (v6,#1)

Brussard, Peter F., and John C. Tull. "Conservation Biology and Four Types of Advocacy." Conservation Biology Vol. 21, no. 1 (2007): 21-4. The four types are (1) professional advocacy, (2) advocacy for science, (3) advocacy for ecosystem services, and (4) advocacy for the natural world.

Buchanan, Allen. "Judging the Past: The Case of the Human Radiation Experiments." The Hastings Center Report 26(May 1996):25. Our reluctance to measure the morality of past practices is more than a nagging problem for moral theorists. The legitimacy of retrospective moral judgment has fundamental implications for how practices and institutions should be viewed, and judged, now. (v7,#2)

Buchanan, James M. Ethics and Economic Progress. Norman: University of Oklahoma Press, 1994. 168 pages. \$19.95. From a lecture series at the University of Oklahoma. The Nobel Prize-winning economist and professor at George Mason University gives a non-technical examination of the ethics-economics nexus, and argues that moral constraints exert important economic effects, such as, the "Puritan" work and saving ethics, the relevance of moral values to economic well-being. Buchanan defends Adam

Smith's widely dismissed distinction between productive and nonproductive labor. (v5,#2)

Buchanan, Patrick, The Great Betrayal: How American Sovereignty and Social Justice Are Being Sacrificed to the Gods of the Global Economy. Little, Brown. Reviewed by Cobb, John B., Jr., in "Against Free Trade: A Meeting of Opposites," Christian Century 115 (no. 29, October 28, 1998):999-1002. Cobb is against free trade because of what it does to third-world labor and the environment; Buchanan is against free trade because it undermines American justice and national sovereignty. But liberal and conservative meet surprisingly. "The real divisions of our time are not between left and right but between nations and the globalist delusion." "America's wealthiest 1 percent, which controlled 21 percent of America's wealth in 1949, now [1995] controls 40 percent. ... Top CEO salaries--44 times the average wage of a worker in 1965--have soared to 212 times." Is there a way to combine economic nationalism and a wider loyalty to Earth and all its people? (v.9,#4)

Buchanan, Rob, "A Natural Death," Outside, vol, 25, no. 6, June 2000, pages 106-114, 152-155. Guy Waterman and his wife authored four books on ethics and conservation of New England wilderness. On February 25, 2000, the coldest day of the year, Waterman, hiked to the top of his favorite peak, Mt. Lafayette (Vermont), and laid down to die by freezing. His body was recovered days later. Gripped by pessimism, Waterman became convinced that the "illusion of wildness is as crucial as wildness itself." (v.11,#2)

Buchholz, Rogene A., "Corporate Responsibility and the Good Society: From Economics to Ecology," Business Horizons (Indiana University Graduate School of Business) 34, no. 4 (1991):19-31. The economic paradigm will continue its dominance as long as human beings consider themselves to be the center of life on earth. (v4,#2)

Buchholz, Rogene A., Principles of Environmental Management: The Greening of Business. Englewood Cliffs, NJ: Prentice-Hall, 1993. Paper. 433 pages. Part I provides background material on the historical development of environmental concerns, principles of ecology, environmental ethics, and public policy. Part II studies major environmental problems: global warming, air pollution, water pollution, pesticides and toxics, waste disposal, deforestation and species decimation, and coastal erosion and wetlands destruction. Part III analyzes strategies for business and strategies for society. Buchholz is in the College of Business Administration, Loyola University of New Orleans. (v3,#3)

Buchmann, Steve, and Nabhan, Gary Paul, The Forgotten Pollinators. Washington, DC: Island Press, 1996. More than 60 kinds of bird and mammal pollinators are known to be endangered and no one has any idea how many insect pollinators are vulnerable to extinction. Honey bees are a doubtful substitute; there are now far fewer honeybees in the U.S. than at any time since World War II, owing to infestations with exotic diseases and pests that are not easily controlled. Within a few years pollinators other than honeybees will be needed to provide \$ 4 billion to \$ 6 billion of annual crop pollination service to America's farmers. (v7,#1)

Budd, Malcolm, "The Aesthetics of Nature," Proceedings of the Aristotelian Society 100(2000):137-157. I begin by demonstrating the inadequacy of the idea that the aesthetic appreciation of nature should be understood as the appreciation of nature as if it were art. This leads to a consideration of three theses: (i) from the aesthetic point of view natural items should be appreciated under concepts of the natural things or phenomena they are, (ii) what aesthetic properties a natural item really possesses is determined by the right categories of nature to experience the item as falling under, and (iii) (the doctrine of positive aesthetics with respect to nature) the natural world untouched by humanity is essentially aesthetically good. I indicate an unclarity in (i) and identify difficulties facing (ii). I distinguish various versions of (iii), reject certain of these, and fault a number of arguments in support of (iii). I conclude that the idea of the aesthetic value of a natural item is such that it endows the aesthetic appreciation of nature with a freedom and relativity denied to the appreciation of art and renders (iii) problematic. With criticisms of Allen Carlson and Holmes Rolston. (v.13,#4)

Budd, Malcolm, "Delight in the Natural World: Kant on the Aesthetic Appreciation of Nature," British Journal of Aesthetics 38(1998):Part I:1-18. Part II:117-126. Part III: 233-250. A tripartite examination of Kant's theory of the aesthetic appreciation of nature. Part I. Beginning with an exposition of Kant's notion of an aesthetic judgment and his classification of noncompound aesthetic judgments, it expounds his theory of beauty, rejects his identification of the distinctive pleasures of the beautiful, rejects his account of a judgment of dependent beauty about a natural object, identifies a gap in his classification of aesthetic judgments about natural items and faults his thoughts about the possibility or impossibility of an ideal of beauty for things of a particular natural kind.

Part II. This part elucidates and defends Kant's claim that a pure judgment of taste does not, of itself, generate an interest, before considering, and rejecting as unconvincing, Kant's arguments for his views that (i) someone who takes an immediate interest in natural beauty can do so only in virtue of possessing the basis of a morally good disposition, (ii) someone who reflects on nature's beauty will

inevitably take an immediate interest in natural beauty, and (iii) each person ought to take such an interest.

Part III. This part expounds Kant's conception of a judgment of the sublime in nature, elucidates his accounts of the mathematically and the dynamically sublime, rejects his account of the emotion of the sublime and presents an alternative. Budd is in philosophy at University College London. (v.13,#4)

Budiansky, Stephen, Nature's Keepers: The New Science of Nature Management. Free Press, 1995. Nature doesn't take care of itself, but needs some management. Wild nature is "a fake" not only now but has been a fake for centuries; there is nothing but human modified nature, "the work of civilized man" (p. 3) "Nature lovers ... have deceived themselves about the true character of their beloved" (p. 5). Even ecologists now realize that nature does not take care of itself well (pp. 6-7). "Perhaps the best model for us to follow is that of the gardener, who ... handles nature with respect but without self-abnegation. He brings the full scope of human aptitudes to bear on the landscape, aesthetic, scientific, utilitarian, even moral; he knows that what he is fashioning his creativity and wisdom; but he knows in the end that the effort is a joint one" (p. 250). Critics of Budiansky are complaining that he uses evidence selectively and often fails to give a balanced representation of those he cites, for example, using Donald Worster as an advocate of balance in nature (p. 17), when Worster in fact argues much the opposite. Budiansky is a senior writer at U.S. News and World Report. (v7,#2)

Budiansky, Stephen, "Killing with Kindness," U.S. News and World Report 121(no. 21, Nov. 25, 1996):48-49. Preserving wildlife has been a moral and practical disaster for the developing world. The paradoxical solution: Use it or lose it. Tourism is no answer. Elephants, for instance, are the darling of the West and enemy number 1 to Africans. (v7,#4)

Budiansky, Stephen, "The Doomsday Myths," U.S. News and World Report, December 13, 1993. By exaggerating environmental dangers, activists have undermined their credibility, and triggered an anti-environmental backlash. None of the global environmental issues now under attack is a hoax. But by overstating evidence, by presenting hypotheses as certainties, and predictions as facts to create a sense of urgency, scientist-activists have overplayed their hand. Myth One: Fifty thousand species a year are being lost to extinction. Myth Two: Forth million acres of tropic rain forest are destroyed each year. Myth Three: The ozone hole is spreading. Myth Four: No serious scientist doubt predictions of global warming. Budiansky is a senior writer at U.S. News and World Report. (v5,#1)

Budiansky, Stephen, "A Special Relationship: The Coevolution of Human Beings and Domesticated Animals," Journal of the American Veterinary Medical Association 204 (no. 3, February 1994):365-368. Domestication represents a coevolved relationship, analogous with many other mutualistic partnerships in nature, in which loss of defensive and self-sufficient behaviors in a species is more than compensated for

by the gain of food, protection, or shelter afforded by close association with another species. This is supported by recent scientific studies, and this undermines the idea that domestication of animals is tantamount to their subjugation or exploitation. Some species--dogs, cats, cattle, house mice, Norway rats, even gourds--have survived by their association with humans. The fittest strategy of the future may be a system of more cooperative, interdependent relationships between such somewhat tamed animals and humans, not an emphasis on those wild and free, untainted by human touch. Lions have been outcompeted by house cats. (v5,#1)

Buege, Douglas J., "The Ecologically Noble Savage Revisited," Environmental Ethics 18(1996):88. The stereotype of the 'ecologically noble savage' is still prevalent in European-American discourses. I examine the empirical justifications offered for this stereotype, concluding that we lack sound empirical grounds for believing in 'ecological nobility.' I argue that the stereotype should be abandoned because it has negative consequences for native peoples. Instead of accepting questionable stereotypes, philosophers and others should focus on the lives of particular peoples in order to understand their philosophies as well as the relationships that they maintain with their homelands. Buege is a philosopher in West Allis, WI and has taught at the University of Wisconsin--Stevens Point. (EE)

Buege, Douglas, "Epistemic Responsibility and the Natural: Toward a Feminist Epistemology for Environmental Philosophy," APA (American Philosophical Association) Newsletter on Feminism and Philosophy 91(1992):73-78.

Buege, Douglas J., "An Ecologically-informed Ontology for Environmental Ethics," Biology and Philosophy 12(1997):1-20. Since the inception of their subject as a distinct area of study in philosophy, environmental ethicists have quarreled over the choice of entities with which an environmental ethic should be concerned. A dichotomous ontology has arisen with the ethical atomists, e.g. Singer and Taylor, arguing for moral consideration of individual organisms and the holists, e.g. Rolston and Callicott, focussing on moral consideration of systems. This dichotomous view is ecologically misinformed and should be abandoned. In this paper, I argue that the organization of the natural world, as viewed by some ecologists and evolutionary biologists, is structured on various levels that are not reducible to one another. This "hierarchical" view, expressed by Salthe and Eldredge, provides the most complete and accurate ontology for environmental ethics. Buege completed a Ph.D. in environmental ethics at the University of Minnesota, Minneapolis, fall 1993, entitled Intrinsic Value, Organic Unity and Environmental Philosophy: Grounding our Values, critiquing existing theories and developing new theories of ontology and intrinsic value with a view to grounding public policy issues. The dissertation advisor was Arthur Caplan, and Karen Warren, of Macalaster College, St. Paul, was a chief mentor. He is now an independent scholar, West Allis, WI. (v8,#3)

Buell, Lawrence. *The Future of Environmental Criticism: Environmental Crisis and Literary Imagination*. Malden, MA: Blackwell Publishing, 2005. "Ecocriticism is an umbrella term ... used to refer to the environmentally oriented study of literature and (less often) the arts more generally, and to the theories that underlie such critical practice" (p. 138). Buell traces the ecocritical movement back to its roots in the 1970s to its proliferation and diversification today. He shows how ecocriticism has moved from the genres of nature writing and nature poetry to all of literary history and discourse, and he addresses issues such as the ecocriticism move from nature preservation to environmental justice, the

meaning of place in a globalizing world, and the interaction of ecocritical aesthetic, ethical, and political concerns. Buell concludes by arguing that the discourses of the environment will become a permanent part of literary and cultural studies.

Bugnion, Veronique, Reiner, David M., "A Game of Climate Chicken: Can EPA Regulate Greenhouse Gases Before the U.S. Senate Ratifies the Kyoto Protocol?" Environmental Law 30(no. 3, 2000):491- .
Bugnion and Reiner explore the various scientific, political, and legal debates regarding the action necessary to reverse the negative effects of global warming. They also discuss the United States Environmental Protection Agency's (EPA) ability to use provisions of the Clean Air Act (CAA) to promulgate and implement emissions standards addressed by the Kyoto Protocol. Finally, the authors conclude that, although EPA's authority to implement such standards is unclear, Congress could amend the CAA to explicitly authorize EPA to promulgate standards for limiting greenhouse gas emissions.

Bulkley, Kelly. "The Quest for Transformational Experience." Environmental Ethics 13(1991) 151-63.

Michael E. Zimmerman claims that the fundamental source of our society's destructive environmental practices is our "dualistic consciousness," our tendency to see ourselves as essentially separate from the rest of the world; he argues that only by means of the transformational experience of nondualistic consciousness can we develop a more life-enhancing environmental ethic. I suggest that dreams and dream interpretation may provide exactly this sort of experience. Dreams present us with powerful challenges to the ordinary categories and structures of our daily lives, and they reveal in numinous, transformational images how we are ultimately members of a web of being that includes all life. I offer Victor Turner's concept of *communitas* as a means of clarifying and unifying the issues Zimmerman and I are discussing. In conclusion I sketch out some of the practical applications of these ideas to the task of improving our society's treatment of the environment. Bulkley is a Ph.D. student at the Divinity School of the University of Chicago, Chicago, IL. (EE)

Bunyard, Peter. "Industrial Agriculture--Driving Climate Change," The Ecologist 26(no.6, 1996):290. Climate change is happening--that's official. Nonetheless, most agronomists argue that human societies can weather the storm without drastic changes to industrialized patterns of farming. Such claims, however, overestimate industry's contribution to climate change and underplay the impact of modern agriculture on climate. By degrading soils and changing patterns of land use, agriculture is disrupting the ability of climate to recover from the perturbations caused by greenhouse gas emissions. The change in rainfall patterns that accompany land degradation, especially in the drylands, is leading to increased water stress and, consequently, towards conditions where terrestrial vegetation may be losing its powers to modulate climate and thus prevent runaway global warming. Burgat, Florence, "Non-violence towards Animals in the Thinking of Gandhi: The Problem of Animal Husbandry," Journal of Agricultural and Environmental Ethics 17(2004):223-248. The question of the imperatives induced by the Gandhian concept of non-violence towards animals is an issue that has been neglected by specialists on the thinking of the Mahatma. The aim of this article is to highlight the systematic - and significant - character of this particular aspect of his views on non-violence. The first part introduces the theoretical foundations of the duty of non-violence towards animals in general. Gandhi's critical interpretation of cow-protection, advocated by Hinduism, leads to a general reflection on the duty of non-violence towards animals, the cow being transformed into the representative of all "dumb

creation." The approach adopted by Gandhi to solving the problem of cow-protection focuses on its practical dimensions and is based primarily on reforming animal husbandry. What limits should be imposed on the exploitation of farm animals within the framework of non-violence? Gandhi devoted nearly 30 years to elaborating an animal husbandry system that would be both economically viable and in conformity with the universal ethical principles he drew from religions (especially Hinduism). The interdiction to kill is absolute, since Gandhi not only rejects the breeding of farm animals for the purposes of butchery but also the slaughtering of animals that are no longer capable of providing the services required of them. He therefore concentrated his efforts on drawing up a scheme to reorganize this activity on a national scale while taking into consideration these constraints, which are less contradictory than they may seem to be at first sight. Reviewing the age-old activity of animal husbandry in the light of non-violence is clearly based on the specific nature of Hindu traditions. However, it goes far beyond cultural or religious relativism, since it is also founded on universal ethical principles. Keywords: ethics, farm animals, Gandhi, non-violence. The author is at INRA-TSV 65, Boulevard de Brandebourg, 94205 Ivry-sur-Seine, France. (JAEE)

Burkett, Paul., "The Value Problem in Ecological Economics: Lessons from the Physiocrats and Marx", Organization and Environment, 16, (No. 2, 2003):137-67. Examines the disputed ecological economics question of whether nature is a direct source and/or substance of value. One group of protagonists ascribes value directly to natural resources and argues that monetary exchange values (prices and profits) largely or fully represent the values extracted from nature, whilst another group focuses on nature as an objective condition or basis for value defined as psychic income or "enjoyment of life". The paper applies Marx's critique of the Physiocrats to this contemporary debate, suggesting that both groups of ecological economists do not adequately consider the relations between use value and capitalist valuation. Burkett is in economics at Indiana State University, Terre Haute. (v 14, # 3)

Burkhardt, Jeffrey, "Crisis, Argument, and Agriculture", Journal of Agricultural Ethics 1(1988):123-138. This paper analyzes the use of "social crisis" as applied to the state of modern agriculture and, by extension, other "crises" such as those in legitimation and morality. The crisis we may be facing with respect to agriculture is more properly understood as a sociopolitical crisis that has broader implications than simply the loss of farms or traditional farming values. Burkhardt is in ethics and policy studies in agriculture and natural resources at the University of Florida, Gainesville.

Burkhardt, Jeffrey, "The Morality Behind Sustainability", Journal of Agricultural Ethics 2(1989):113-128. This article discusses the arguments that can be advanced for sustaining anything and initially concludes that our obligations to future generations entail sustaining more than just sufficient food production or an adequate resource base. Indeed, a tradition of care and community must underlie whatever agricultural and resource strategies we are to develop under the rubric of sustainability. Burkhardt is in ethics and policy studies in agriculture and natural resources at the University of Florida, Gainesville.

Burnett, G. W., and Kamuyu wa Kang'ethe, "Wilderness and the Bantu Mind." Environmental Ethics 16(1994):145-160. In the West, it is widely believed that, since Africans lack an emotional experience with romanticism and transcendentalism, they do not possess the philosophical prerequisites necessary to protect wilderness. However, the West's disdain for African systems of thought has precluded examination of customary African views of wilderness. Examination of ethnographic reports on Kenya's Highland Bantu reveals a complex view of phenomena that the West generally associates with wilderness. For the Bantu, wilderness is an extension of human living space, and through concerted social action rather than individual initiative, it is, or at least can be, dominated by society. Wildlife is unnatural and alienated from human society, which is natural. Because wilderness is, consequently, understood to be fearsome and hostile, it is not a place that can provide inspiration or self-actualization. Almost all forests have a special spiritual relationship with humankind, and some trees have a special relationship with God. Although traditional Bantu thought is contrary to a concept of wilderness as conserved, managed space filled with tourists and recreators, it does embrace a concept of wilderness as wildlands. The Bantu have gone to considerable length to develop an approach to wilderness that minimizes individual contact while requiring association with wilderness as a social activity. Population growth and want of vocational opportunities continue to thrust Highland Bantu into wilderness as a fundamental and traditional survival technique. Burnett is in Parks, Recreation and Tourism, Clemson, SC; Kang'ethe is in sociology and religion, Cardinal Stritch College, Milwaukee, and formerly of Nairobi, Kenya. (EE)

Burnett, G. W. and Lisa M. Butler Harrington, "Early National Park Adoption in Sub-Saharan Africa," Society and Natural Resources 7(1994):155-168. National parks are widely thought to have begun in Yellowstone National Park in the U.S. in 1872 and to have spread around the world from that inspiration. But parks were adopted early in southern Africa and spread rapidly through much of sub-Saharan Africa. The earliest preservation activities were oriented toward watershed protection and erosion control in fynbos areas. The game reserve orientation of some parks originated later. Burnett is in recreation and tourism at Clemson University, Harrington in geology/geography at Eastern Illinois University. (v5,#4)

Burnett, G. W., and Kamuyu wa Kang'ethe, "Wilderness and the Bantu Mind." Environmental Ethics 16(1994):145-160. Burney, Jonathan. "Is Valuing Nature Contributing to Policy Development?" Environmental Values 9(2000):511-528. Abstract: This paper examines technical, ethical and ecological science perspectives on environmental valuation, and discusses problems in terms of the implications for practical policy-making. It suggests that all these perspectives raise legitimate concerns about the use of stated preference methods, but concludes that such methods still have a role to play in policy making for nature conservation provided they are applied in the right circumstances, designed very carefully, and used in conjunction with other decision-making tools. Keywords: Nature, biodiversity valuation, ecosystem functions, cost-benefit. Jonathan Burney resides at English Nature, Northminster House, Peterborough PE1 1UA, UK. (EV)

Burnley, I. H., "Population and Environment in Australia: Issues in the Next Half Century," Australian Geographer 34(no. 3, 2003):267-280. Varying sets of environmental ethics and values considered in relation to Australia's global responsibilities and commitments. An increase in population to 26 million by 2050 will not place severe stresses on the physical environment, provided that environmental and resource management strategies are put firmly in place, and if consumption and resource use practices are significantly modified. The environmental perspective that rejects growth and diversity among humans while embracing environmental conservation is an inward-looking nationalism/environmentalism that is harmful both to Australia's moral integrity as a nation, and in local and world citizenship. Australia is in a position to receive quite a number of refugees from other, degrading nations. Burnley is in geography, University of New South Wales, Sydney, Australia.

Burns, Kelly A., "Warren's Ecofeminist Ethics and Merleau-Ponty's Body-Subject: Intersections," Ethics and the Environment 13(no. 2, 2008):101-118. While Karen Warren offers an ecofeminist ethic that is pluralistic, contextualist, and challenges Cartesian dualism, one area that remains underdeveloped in her theory is embodiment. I will examine Merleau-Ponty's notion of embodied subjectivity and show that it would fit consistently with her theory. I will also explore some other areas in which the two theories supplement each other. Burns is assistant professor of philosophy at Dominican University in River Forest, IL.

Storms, floods, droughts, introduction of exotic species, pathogens, earthquakes, and hurricanes. How individuals, communities, and nations respond and what factors condition and restrain those responses. First issued in 1978. (v9,#1)

Burton, Ian and Peter Timmerman, "Human Dimensions of Global Change: A Review of Responsibilities and Opportunities," International Social Science Journal 41(1989):297-313. "Ordinary human interactions with the environment are entering a new stage that calls for an extraordinary response." "As we now enter the era of global change, a new relationship has to be forged between human society and environment, which will be morally, economically and ecologically sustainable." "A new environmental ethic and a coalition of reason will be needed." "The moral solidarity of humankind must continue to grow." The authors are in geography, International Federation of Institutes for Advanced Study, Toronto. This whole journal issue is on the theme: Reconciling the Sociosphere and the Biosphere: Global Change, Industrial Metabolism, Sustainable Development, Vulnerability. (v5,#4)

Burton, Jeanne L., & McBride, Brian W., "Recombinant Bovine Somatotropin (rbST): Is There a Limit for Biotechnology in Applied Animal Agriculture?", Journal of Agricultural Ethics 2(1989):129-159. The intent of this article is to outline, integrate, and interpret relevant scientific, economic, and social issues of rbST technology that have contributed to the acceptance dilemma for this product. Although this article demonstrates that rbST has met most physiological criteria for acceptance, the consuming public has treated the acceptance issue with forceful skepticism. The question this article addresses is, why? Burton and McBride are in animal and poultry science at the University of Guelph, Ontario.

Busch, Lawrence, "Virgil, vigilance, and voice: Agrifood ethics in an age of globalization," *Journal of Agricultural and Environmental Ethics* 16(2003):459-477. Some 2000 years ago, Virgil wrote *The Georgics*, a political tract on Roman agriculture in the form of a poem. Today, as a result of rising global trade in food and agricultural products, growing economic concentration, the merging of food and pharmacy, chronic obesity in the midst of hunger, and new disease and pest vectors, we are in need of a new Georgics that addresses the two key issues of our time: vigilance and voice. KEY WORDS: agricultural policy, democracy, governance, standards, Virgil. (JAEE)

Busch, Lawrence, "The Homiletics of Risk," *Journal of Agricultural and Environmental Ethics* 15(no. 1, 2002):17-29. Today there is considerable disagreement between the US and the EU with respect to food safety standards. Issues include GMOs, beef hormones, unpasteurized cheese, etc. In general, it is usually asserted that Europeans argue for the precautionary principle (with exceptions such as the Sanitary and Phytosanitary Agreement where "substantial equivalence," a form of familiarity, is used) while Americans defend risk analysis or what is sometimes described as the familiarity principle. This is not to

suggest that EU member countries agree on how the precautionary principle should be applied; considerable differences exist among nations as will be noted below.

I review both positions arguing that they are best understood as variants of the homiletics of risk rather than as differing scientific positions. I conclude that while science must necessarily enter into the formulation of food and agricultural standards, state policy, private economic interests, and the interface between the two (e.g., when democratic states are successfully lobbied to support particular private interests), play important roles in determining how particular risks will be treated. Moreover, I argue that the role of science must necessarily be limited if its credibility is to be preserved. KEY WORDS: food safety, genetically modified organisms, policy, regulation, risk, standards. Busch is with the Institute for Food and Agricultural Standards, Michigan State University, East Lansing, MI. (JAE)

Busch, Lisa. "Saving Whales Contentiously," Bioscience 46(no.10, 1996):737. Not everyone in Hawaii is happy about providing a sanctuary for humpbacks. (v7,#4)

Bush, George on Environmental Ethics. On June 8, 1989, President George Bush outlined five principles of his administration's environmental ethic in an address to the Sixth International Waterfowl Symposium in Washington, DC. Bush said, "It's time to renew the environmental ethic in America," and went on to claim that "the environment is a moral issue, ... it is imperative that we preserve the earth and all its blessings," citing Aldo Leopold and his land ethic. Bush emphasized his policy of "no net loss" of wetlands. See story in Earth Ethics, vol. 1, no. 2, p. 10. (v1,#2)

Business and the Environment is the theme issue of Illahee: Journal for the Northeast Environment, vol. 10, no. 1, spring 1994. Sample article: Stuart L. Hart, University of Michigan, "How Green Production Might Sustain the World." Also a section featuring businesses that are making more effort in environmental responsibility. Species, Habitats, and Ecological Health is the theme of vol. 10, no. 2, summer 1994. Sample article: Gordon H. Orians, "Endangered Species and Endangered Habitats," arguing that, although the potential benefits of the Endangered Species Act are considerable, there are many flexible options available, under existing law, giving ample authority for an ecosystem approach to conserving the nation's living species and habitats. Contact: Institute for Environmental Studies, University of Washington, Seattle, WA 98195. (v5,#3)

Business Ethics Quarterly, vol. 5, no. 4, October 1995 is a theme issue on business and the environment. Contains:

- Westra, Laura, "The Corporation and the Environment," Business Ethics Quarterly 5(1995):661-673.
- Brenkert, George G., "The Environment, The Moralists, the Corporation and Its Culture," Business Ethics Quarterly 5(1995):675-697. Business has its own special "ethics," which relates not simply to the internal nature of the corporation but also to the corporate (free market) system. Given this special ethics, business cannot in general be environmentally responsible in the manner that classical moralists demand. More far-reaching changes are needed.
- Frederick, Robert E., and W. Michael Hoffman, "Environmental Risk Problems and the Language of Ethics," Business Ethics Quarterly 5(1995):699-711. Six criteria for assessing proposed solutions to environmental risk problems. But before these criteria can be used business persons must be willing to discuss the problem in ethical terms, and they are often reluctant to do so.
- Halme, Minna, "Environmental Issues in Product Development Process," Business Ethics Quarterly 5(1995):713-733. Studies a shift of a managerial paradigm in a business organization from "traditional management thinking" to "environment-related management."
- Rolston, Holmes, III, "Environmental Protection and an Equitable International Order: Ethics after the Earth Summit," Business Ethics Quarterly 5(1995):735-752. The UNCED Summit established two new principles of international justice: an equitable international order and protection of the environment. Wealth is asymmetrically distributed; approximately one-fifth of the world produces and consumes approximately four-fifths of goods and services. This difference can be interpreted as both an earnings

differential and as exploitation; responses may require justice or charity, producing and sharing.

--Shrader-Frechette, Kristin S., "Environmental Risk and the Iron Triangle," Business Ethics Quarterly 5(1995):753-777. There appears to be an iron triangle of industry, government, and consultant/contractors promoting the siting of the first permanent geological repository of high-level nuclear waste and spent fuel proposed for Yucca Mountain, Nevada. The iron triangle has ignored important epistemological and ethical difficulties with the proposed facility.

--Orts, Eric W., "A Reflexive Model of Environmental Regulation," Business Ethics Quarterly 5(1995):779-794. We should begin to consider a new model of reflexive environmental law. This regulatory strategy aims to provide more reflective as well as more efficient environmental regulation.

Butler, Steven, "Rod? Reel? Dynamite," U.S. News and World Report 121(no. 21, Nov. 25, 1996):56-57. Devastation of the coral reefs in the Philippines by local peoples fishing with dynamite and capturing aquarium fish by stunning them with cyanide. (v7,#4)

Butler, Victoria, "Unquiet on the Western Front: Controversy in Kenya," International Wildlife 28 (no. 6, Nov./Dec. 1998): 12-24. Controversy about conservation strategy and the extent to which it can and ought to include local peoples, in a land where the population has grown from 9 to 28 million in three decades, and encroachments on wildlife parks has reduced the wildlife by 44%, both by direct impact and by reduced buffer zones. The current head of the Kenya Wildlife Service is David Western, who favors more concessions to local people. Former head Richard Leakey takes a harder line and believes that the

concessions will prove the park's undoing, as well as unraveling Kenya's tourism, vital in the Kenyan economy. (v.9,#4)

Butler, W.F., and T.G. Acott, "An Inquiry Concerning the Acceptance of Intrinsic Value Theories of Nature," *Environmental Values* 16(2007): 149-168. This study empirically assesses the extent to which intrinsic value theories of nature are accepted and acknowledged outside the realm of academic environmental ethics. It focuses on twenty of the largest landowning organisations in England, including both conservation and non-conservation organisations and investigates the environmental philosophical beliefs and values held by representative individuals of these groups. An in-depth interview was held with a representative from each organisation. The interviews were analysed using qualitative data analysis software and the results compared against a backdrop of academic philosophical positions. The study found that an ecocentric position which acknowledges nature's intrinsic value was adopted by the majority of respondents, both from conservation and non-conservation organisations. However, it was also found that individuals felt the idea of nature's intrinsic value was generally not reflected in organisational policy. The authors are at the Department of Earth and Environmental Science, University of Greenwich, Kent, UK.

Byers, E. Sandra, "Wilderness Camping as a Therapy for Emotionally Disturbed Children: A Critical Review," *Exceptional Children* 45 (no. 8, May 1979):628-635 (Journal of the Council for Exceptional Children, Reston, VA) The wilderness camp has been described as a particularly good setting for treatment of emotionally disturbed children. This article summarizes the current literature on therapeutic camping, including the nature of existing programs, rationales for the superiority of camping as a therapeutic program, and evaluation of existing programs. The results of program evaluation research reported in the literature provides only minimal support for any particularly effectiveness ascribed to therapeutic camping in terms of either short-term or long-term therapeutic outcome. This is largely due to inadequate investigation of the process and/or the outcome of therapeutic camping. Byers is in psychology, University of New Brunswick, Fredericton, New Brunswick, Canada.

Byrne, J. Peter, "Basic Themes For Regulatory Takings Litigation," *Environmental Law* 29 (No. 4, 1999):

811- . Professor Byrne presents arguments for a narrow reading - consistent with the original understanding - of the Fifth Amendment's Takings Clause. He explains how these arguments, called "litigation themes," can be used in regulatory takings cases to advance this position. He stresses that the use of litigation themes is particularly important in the regulatory takings context because of the ambiguities and contradictions in the case law on the subject. (v.11,#2)

Cadigan, Tui, "Land Ideologies that Inform a Contextual Maori Theology of Land," Ecotheology Vol 6 (Jul 01/Jan 02):123-137. thasista@ihug.co.nz This paper is primarily concerned with a Maori theological perspective with regard to relationship to land. A series of traditional Maori concepts are employed to articulate this three-way relationship between God-Land-People. The ideologies dealt with here were selected from a list of seven ideologies of land Maori identify with. The context is Aotearoa, the people referred to are the local indigenous people, namely Maori, also known as Tangata Whenna. To assist international readers some brief referencing to possible similarities and obvious differences with the Christian scriptural theological perspective have been applied. The paper seeks to share with the reader something of the depth of relationship Maori have to their environment generally and to land in particular.

Cadman, David, Review of Short, John Rennie, Imagined Country. Environmental Values Vol.1 No.3(1992):278.

Cafaro, Philip, and Verma, Monish. "For Indian Wilderness." Terra Nova 3 (no. 3, 1998): 53-58. A wilderness, on one important definition, is a place which remains largely unmodified by human beings. Due to increased human numbers and technological power, only places mandated by law will remain as wildernesses in the coming centuries. Wilderness preservation gains support from two cornerstone positions of Western environmentalism, as it has developed over the past twenty years. First, the view articulated within environmental ethics that wild, non-human nature, or at least some parts of it, has intrinsic value and that it should be treated respectfully as a consequence. Second, the understanding developed within conservation biology that we have entered a period of massive anthropogenic extinction

of biological species and biodiversity loss, that human economic activities are the major cause of this, and that landscape-level habitat preservation is essential for ameliorating it.

Recently, some writers have argued that wilderness preservation is a specifically American or Western preoccupation, whose promotion in the third world amounts to cultural imperialism. According to Ramachandra Guha, for example, wilderness preservation is inappropriate and unnecessary in the third world, whose peoples face more pressing environmental issues, centered on meeting basic human needs. In effect, Guha denies the intrinsic value of non-human nature and dismisses as unimportant the loss of biodiversity in the third world.

In opposition to this well-intentioned anthropocentrism, we argue that non-human nature retains intrinsic value in the third world, as in the first. Furthermore, biodiversity loss is not in the interests of third world citizens, but will lead rather to their material, intellectual and spiritual impoverishment. In order to stem such loss, we advocate, with Guha, sustainable development for the poor, decreased consumption among the rich, and wilderness preservation, worldwide. Cafaro teaches philosophy at Southwest State University, Marshall, Minnesota. Verma is a consultant for UNICEF in New Delhi, India. (v.9,#3)

Cafaro, Philip, "Environmental Virtue Ethics: An Introduction," Philosophy in the Contemporary World 8 (Number 2, Fall-Winter 2001):1-3. Introduction to a special double issue of the journal devoted to the topic of environmental virtue ethics. Articles by Geoffrey Frasz, John O'Neill, Louke van Wensveen and eleven other contributors. 160 pages total. To order a copy, contact the Philosophy Documentation Center. (v.13,#2)

Cafaro, Philip, "Rachel Carson's Environmental Ethics," Worldviews: Environment, Culture, Religion 6(2002):58-80. Rachel Carson is well known as a founder of the modern environmental movement. Her life and writings have much to offer contemporary environmental philosophy. I begin by discussing the environmental ethics articulated in Silent Spring. I next examine Carson's earlier natural history writings and the non-anthropocentrism they express. I conclude with some suggestions for how Carson points the way forward for environmental ethics. (An abridged version of this article appeared in Reflections: Newsletter of the Program for Ethics, Science, and the Environment, volume 9, no. 2 (May, 2002): 17-21.) (v.13,#4)

Cafaro, Philip and Primack, Richard, "Ecological Integrity: Evaluating Success in National Parks and Protected Areas." In J. Bottrill, ed., Encyclopedia of Life Sciences (New York: MacMillan Publishers: 2002). Volume 6, pp. 136-141. National parks and protected areas have been established for a variety of purposes, but three concepts are important in defining what we are trying to protect: wilderness, biodiversity, and ecological integrity. These concepts can be used to evaluate the success of a park or protected area.

Cafaro, Philip, book review of Peter Singer, One World: the Ethics of Globalization, Conservation Biology 18 (no. 2, 2004): 585-6.

Cafaro, Philip, "Review of: Peter Singer, One World: The Ethics of Globalization," Conservation Biology 18(2004):585-586. (v. 15, # 3)

Cafaro, Philip and Primack, Richard, "Ethical Issues in Biodiversity Protection," Encyclopedia of Biodiversity 2: 593-607. Conservationists and conservation biologists share a basic ethical commitment to preserve biodiversity. But ethical disagreements and dilemmas arise in the attempt to realize this commitment. This article examines some important ethical issues faced by those who seek to protect biodiversity. (v.11,#4)

Cafaro, Philip, Thoreau's Living Ethics: Walden and the Pursuit of Virtue. Athens: University of Georgia

Press, 2004. The first full, rigorous account of Henry Thoreau's ethical philosophy. Focused on Walden but ranging widely across his writings, the study situates Thoreau within a long tradition of ethical thinking in the West, from the ancients to the romantics and on to the present day. Cafaro shows Thoreau developing a comprehensive virtue ethics, less based in ancient philosophy than many recent efforts and more grounded in modern life and experience. He presents Thoreau's evolutionary, experimental ethics as superior to the more static foundational efforts of current virtue ethicists. Another main focus is Thoreau's environmental ethics; the book shows Thoreau not only anticipating recent arguments for wild nature's intrinsic value, but also demonstrating how a personal connection to nature furthers self-development, moral character, knowledge, and creativity. Thoreau's life and writings, argues Cafaro, present a positive, life-affirming environmental ethics, combining respect and restraint with an appreciation for human possibilities for flourishing within nature. (v.14, #4)

Cafaro, Philip, review of video "Suits and Savages: Why the World Bank Won't Save the World," Organization and Environment 14 (2001): 463-465. Takes filmmakers to task for ignoring the needs of wildlife. "The film makers share the World Bank's tradition view that people and their concerns are all important. They differ on which people they care about and what they think is best for them." (v.12,#4)

Cafaro, Philip, "Less is More: Economic Consumption and the Good Life." Philosophy Today 42(1998): 26-39. We should judge economic consumption on whether it improves or detracts from our lives, and act on that basis. The issue of consumption is placed in the context of living a good life, in order to discuss its justifiable limits. Two important areas of our economic activity, food consumption and transportation, are examined from an eudaimonist perspective.

From the perspective of our enlightened self-interest, we see that when it comes to economic consumption, less is more. Not always, and not beyond a certain minimum level. But often, less is more; especially for the middle and upper class members of wealthy industrial societies. This is the proper perspective from which to consider environmentalists' calls for limiting consumption in order to protect nature. (v.9,#3)

Cafaro, Philip, "Rachel Carson's Environmental Ethics," Reflections 9 (Number 2, Spring, 2002):17-21. Lays out Carson's environmental ethics based on a careful reading of Silent Spring and the natural history writings. (v.13,#2)

Cafaro, Philip, "Nature's Star Witness," Conservation Biology 14(2000):911-912. Review of L. Lear, Rachel Carson: Witness for Nature (New York: Holt, 1997) and R. Carson, Lost Woods: The Discovered Writings of Rachel Carson (Boston: Beacon Press, 1998). (v.11,#2)

Cafaro, Philip Justin. Thoreau's Vision of a Good Life in Nature: Towards an Environmental Virtue Ethics. Ph. D. thesis, Boston University Graduate School of Arts and Sciences, 1997. Major Professor: Michael Martin, Professor of Philosophy. Environmental ethics from a virtue ethics perspective. Positive relationships to nature are necessary to a good human life, while negative relationships stunt and limit us. The thesis is developed through a consideration of the writings of Henry David Thoreau, focusing on his analyses of two important areas of our lives: economic activity and the pursuit of knowledge. It brings Thoreau into current environmental debates with the goal of furthering the creation of a strong environmental virtue ethics, arguing that an enlightened self-interest demands environmental protection and the preservation of wild nature.

Part one outlines a theory of virtue ethics and develops a position on the nature and limits of ethical justification. It then explores Thoreau's method of ethical theorizing, a blend of analysis, experiment, exhortation and story-telling.

Part two presents Thoreau's economic philosophy and argues for its contemporary relevance. Treating economics within the context of virtue ethics, Thoreau argues that the real importance of our economic lives lies in what sorts of people they make us, and in how they relate us to other people and to

nature. Because modern economic theory takes a narrower view of the purpose of economic life, these chapters challenge both our economic lives and currently accepted ways of understanding them.

Part three considers the role of the search for knowledge in a good life. One chapter explores Thoreau's career as a naturalist and argues that the study of natural history is an important avenue for personal growth and fulfillment. A second considers Thoreau's ambivalent yet lasting interest in natural science and his contributions to the nascent science of ecology. Building on recent insights into the importance of narrative to virtue ethics, it discusses the stories that individual scientists may tell about their activities, and the stories that we may tell of science itself, as the career of humanity knowing nature. This dissertation argues that stories which include loving and respectful relationships to nature are superior to those which promote its control and domination.

Cafaro is now assistant professor of philosophy at Southwest State University, Marshall, Minnesota. (v.9,#3)

Cafaro, Philip, and Primack, Richard, "Ethical Issues in Biodiversity Protection." In Levin, Simon Asher, Encyclopedia of Biodiversity (San Diego: Academic Press [Harcourt], 2001), vol. 2:593-607. (v.13,#1)

Cafaro, Philip, "For a Grounded Conception of Wilderness and More Wilderness on the Ground," Ethics and the Environment 6(no. 1, 2001):1-17. Recently a number of influential academic environmentalists have spoken out against wilderness, most prominently William Cronon and J. Baird Callicott. This is odd, given that these writers seem to support two cornerstone positions of environmentalism as it has developed over the past twenty years: first, the view articulated within environmental ethics that wild, nonhuman nature, or at least some parts of it, has intrinsic or inherent value; second, the understanding developed within conservation biology that we have entered a period of massive anthropogenic biodiversity loss and that landscape-level habitat preservation is essential for combating this. I argue here that Cronon and Callicott are wrong. In fact, an ethics of respect for nonhuman nature and an informed, scientific understanding of what is necessary to preserve it do strongly support increased wilderness preservation. Cafaro is in philosophy, Colorado State University. (E&E)

Cafaro, Philip, "Thoreauvian Patriotism as an Environmental Virtue." Philosophy in the Contemporary World 2 (1995): 1-9. In Walden Henry David Thoreau argues for and against patriotism. Thoughtful environmentalists should do likewise. Thoreau's accounts of "settling" and farming are efforts to rethink and deepen his connections to the land. These efforts define a patriotism that is local, thoughtful and moral, and Thoreau's economic philosophy can be seen as applied patriotism. Like other virtues such as courage or prudence, patriotism is liable to a skewed development and various kinds of misuse. Yet properly developed it is a part of a good human life. Thoreauvian patriotism provides a strong base from which to oppose militarism and xenophobia, which many intellectuals mistakenly equate with patriotism. (v.9,#3)

Cafaro, Philip, "The Naturalist's Virtues," Philosophy in the Contemporary World 8 (Number 2, Fall-Winter 2001):85-99. This paper argues that studying natural history helps make us more virtuous; that is, better and happier people. After sketching a broad conception of virtue, It discusses how naturalizing may improve our moral character and help develop our intellectual, aesthetic and physical abilities. It asserts essential connections between non-anthropocentrism and wisdom, and between natural history study and the achievement of a non-anthropocentric stance toward the world. Finally, it argues that the great naturalists suggest a noble, inspiring alternative to the gross consumption and trivial pleasures offered by our destructive modern economy: the exploration, understanding and appreciation of nature. It concludes

that a better understanding of our enlightened self-interest would do as much to further environmental protection as the acknowledgment of nature's intrinsic value. (v.13,#2)

Cafaro, Philip J., Richard B. Primack and Robert L. Zimdahl, "The Fat of the Land: Linking American Food Overconsumption, Obesity, and Biodiversity Loss," Journal of Agricultural and Environmental Ethics 19(2006):541-561. Americans' excessive consumption of food harms their health and quality of life and also causes direct and indirect environmental degradation, through habitat loss and increased pollution from agricultural fertilizers and pesticides. We show here that reducing food consumption (and eating less meat) could improve Americans' health and well-being while facilitating environmental benefits ranging from establishing new national parks and protected areas to allowing more earth-friendly farming and ranching techniques. We conclude by considering various public policy initiatives to lower per capita caloric intake and excessive meat consumption, and to translate this temperate behavior into substantial environmental protection. Keywords: biodiversity - consumption - environmental protection - food ethics - obesity - overconsumption - sustainability - temperance. Cafaro and Zimdahl are in the Department of Philosophy, Colorado State University, Fort Collins, CO. (JAEE)

Cafaro, Philip. "Thoreau, Leopold, and Carson: Toward an Environmental Virtue Ethics." Environmental Ethics 23 (2001):3-18. I argue for an environmental virtue ethics which specifies human excellence and flourishing in relation to nature. I consider Henry David Thoreau, Aldo Leopold, and Rachel Carson as environmental virtue ethicists, and show that these writers share certain ethical positions that any environmental virtue ethics worthy of the name must embrace. These positions include putting economic life in its proper, subordinate place within human life as a whole; cultivating scientific knowledge, while appreciating its limits; extending moral considerability to the nonhuman world; and supporting wilderness protection. I argue that Thoreau, Leopold, and Carson themselves exemplify the potential for cultivating excellence in engagement with wild nature: their lives are among our most powerful arguments for its preservation. Cahen, Harley, "Against the Moral Considerability of Ecosystems," Environmental Ethics 10(1988):195-216. This article is a challenge to the land ethic of Leopold or any other holistic environmental ethic, for Cahen denies that ecosystems are morally considerable in themselves. Even if all goal-directed behavior is morally considerable, there is a difference between the goals and incidental by-products of activity. Ecosystemic theory is individualistic; it assumes that the stability of systems is not a goal but a by-product of numerous individual behaviors. Cahen rests this argument on the lack of group or community selection in natural systems. But this argument is based on only one side of current debates in evolutionary ecological theory. For more discussion, see Stanley and Barbara Salthe, "Ecosystem Moral Considerability: A Reply to Cahen," Environmental Ethics 11 (1989):355-361. (Katz, Bibl # 2)

Cahen, Harley. "Against the Moral Considerability of Ecosystems." Environmental Ethics 10(1988):195-216. Are ecosystems morally considerable--that is, do we owe it to them to protect their "interests"? Many environmental ethicists, impressed by the way that individual nonsentient organisms such as plants tenaciously pursue their own biological goals, have concluded that we should extend moral

considerability far enough to include such organisms. There is a pitfall in the ecosystem-to-organism analogy, however. We must distinguish a system's genuine goals from the incidental effects, or byproducts, of the behavior of that system's parts. Goals seem capable of giving rise to interests; byproducts do not. It is hard to see how whole ecosystems can be genuinely goal-directed unless group selection occurs at the community level. Currently, mainstream ecological and evolutionary theory is individualistic. From such a theory it follows that the apparent goals of ecosystems are mere byproducts and, as such, cannot ground moral considerability. Cahen is in the department of Natural Resources, Cornell University, Ithaca, NY. (EE)

Callahan, Daniel, "Can Nature Serve as a Moral Guide?" Hastings Center Report 26 (no. 6, Nov.-Dec. 1996):21-27, a short essay, with short replies by Leon R. Kass, "The Troubled Dream of Nature as a Moral Guide," by Bryan G. Norton, "Moral Naturalism and Adaptive Management," and by Strachan Donnelley, "Nature as a Reality Check." Callahan: "I have never quite given up the hope that nature might put in a reappearance in ethics. ... The supposed naturalistic fallacy is, on closer inspection, an odd kind of fallacy since `is' is all the universe has to offer, to say that it cannot be the source of an `ought' is tantamount to saying a priori that an ought can have no course at all--and to say that is no less than to say there can be no oughts. ... Quite apart from these philosophical puzzles, it is useful to note that there is now a major field of inquiry and action right under our noses where nature is frequently held up--with little objection--as the standard for proper behavior." Kass: "Natural knowledge may be very useful in

selecting our means, but not in discerning our ends, and it is utterly useless in deciding how to balance one good against another." Callahan is the retiring president of the Hastings Center. The whole collection of four pieces could be quite profitably read for discussion in a single class hour, in an introductory philosophy class, as well as in an environmental ethics class. (v7,#4)

Callicott, J. Baird, "Conservation Values and Ethics" in Gary K. Meffe and C. Ronald Carroll, eds., Principles of Conservation Biology (Sunderland, MA: Sinauer Associates, Inc., 1994), pp. 24-49. A useful introduction to environmental ethics and value theories for conservation biology students, in a large text, see separate entry. Also useful for introductory philosophy students at freshmen and sophomore levels. Focuses on Norton, Taylor, Rolston, Sagoff, Singer, Regan, Goodpaster, all brought into the perspective of Aldo Leopold and a concentric circle theory of ethics. Excellent for condensing the main issues into a short article. With box essays by Holmes Rolston, III, "Our Duties to Endangered Species," by Susan P. Bratton, "Monks, Temples, and Trees: The Spirit of Diversity," and by Roderick F. Nash, "Discovering Radical Environmentalism in our Own Cultural Backyard: From Natural Rights to the Rights of Nature." Callicott is in philosophy at the University of Wisconsin, Stevens Point. Callicott, J. Baird. "Hume's Is/Ought Dichotomy and the Relation of Ecology to Leopold's Land Ethic." Environmental Ethics 4(1982):163-74. Environmental ethics in its modern classical expression by Aldo Leopold appears to fall afoul of Hume's prohibition against deriving ought-statements from is-statements since it is presented as a logical consequence of the science of ecology. Hume's is/ought dichotomy is reviewed in its historical theoretical context. A general formulation bridging is and ought, in Hume's terms, meeting his own criteria for sound practical argument, is found. It is then shown that Aldo Leopold's land ethic is expressible as a special case of this general formulation. Hence Leopold's land ethic, despite its direct passage from descriptive scientific premises to prescriptive normative conclusions, is not in violation of any logical strictures which Hume would impose upon axiological reasoning. Callicott is in the department of philosophy, University of Wisconsin-Stevens Point, Stevens-Point, WI. (EE)

Callicott, J. Baird, "The Metaphysical Transition in Farming: From the Newtonian-Mechanical to the Eltonian Ecological", Journal of Agricultural Ethics 3(1990):36-49. Modern agriculture is subject to a metaphysical as well as an ethical critique. As a casual review of the beliefs associated with food production in the past suggests, modern agriculture is embedded in and informed by the prevailing modern world view, Newtonian Mechanics, which is bankrupt as a scientific paradigm and unsustainable as an agricultural motif. A new holistic, organic world view is emerging from ecology and the new physics marked by four general conceptual features. A future post-modern ecological agriculture will help to solve the ethical problems engendered by modern mechanical agriculture. Callicott is in philosophy at the University of Wisconsin, Stevens Point.

Callicott, J. Baird. "The Case against Moral Pluralism." Environmental Ethics 12(1990):99-124. Despite Christopher Stone's recent argument on behalf of moral pluralism, the principal architects of environmental ethics remain committed to moral monism. Moral pluralism fails to specify what to do when two or more of its theories indicate inconsistent practical imperatives. More deeply, ethical theories are embedded in moral philosophies and moral pluralism requires us to shift between mutually inconsistent metaphysics of morals, most of which are no longer tenable in light of postmodern science. A univocal moral philosophy--traceable to David Hume's and Adam Smith's theory of moral sentiments, grounded in evolutionary biology by Charles Darwin, and latterly extended to the environment by Aldo Leopold--provides a unified, scientifically supported world view and portrait of human nature in which multiple. Lexically ordered ethics are generated by multiple human, "mixed," and "biotic" community

memberships. Callicott is in the department of philosophy, University of Wisconsin-Stevens Point, Stevens-Point, WI. (EE)

Callicott, J. Baird. "Animal Liberation: A Triangular Affair." Environmental Ethics 2(1980):311-38. The ethical foundations of the "animal liberation" movement are compared with those of Aldo Leopold's "land ethic," which is taken as the paradigm for environmental ethics in general. Notwithstanding certain superficial similarities, more profound practical and theoretical differences are exposed. While only sentient animals are morally considerable according to the humane ethic, the land ethic includes within its purview plants as well as animals and even soils and waters. Nor does the land ethic prohibit the hunting, killing, and eating of certain animal species, in sharp contrast to the humane ethic. The humane ethic rests upon Benthamic foundations: pain is taken to be the ultimate evil and it is reductive or atomistic in its moral focus. The land ethic, on the other hand, is holistic in the sense that the integrity, stability, and beauty of the biotic community is its summum bonum. A classical antecedent of some of the formal characteristics of the land ethic is found in Plato's moral philosophy. Special consideration is given to the differing moral status of domestic and wild animals in the humane and land ethics and to the question of moral vegetarianism. Callicott is in the department of philosophy, University of Wisconsin-Stevens Point, Stevens-Point, WI. (EE)

Callicott, J. Baird, "Conservation Ethics and Fisheries Management," Fisheries: A Bulletin of the American Fisheries Society, vol. 16, no. 2, (March-April 1991):22-28. Leopold's land ethic applied to fisheries management, with attention to whether we ought to stock exotic fish. "While the first commandment of the Leopold Land Ethic, thou shalt not extirpate species or render them extinct, is categorical; the second is hypothetical: thou mayest introduce exotics provided thou exerciseth great caution in doing so." A case in point: "California's Clear Lake, 'one of the oldest lakes in North America,' originally had 12 native fish species. It is now home to 23. Thus, it is presently nearly twice as diverse as in its historical ('natural') condition and presumably ecologically stable." Regrettably, "the introduction of 16 species has made Clear Lake a much richer fishery than formerly, but five of the natives were extirpated, of which two are now globally extinct. In absolute terms the planet is poorer." Callicott is professor of philosophy, University of Wisconsin, Stevens Point. (v2,#2)

Callicott, J. Baird, "Land Ethic" (Environmental Ethics), Encyclopedia of Bioethics, revised ed. (New York: Macmillan Library Reference, Simon and Schuster, 1995), 688-90. (v6,#2)

Callicott, J. Baird. "The Metaphysical Implications of Ecology." Environmental Ethics 8(1986):301-16. Although ecology is neither a universal nor foundational science, it has metaphysical implications because it profoundly alters traditional Western concepts of terrestrial nature and human being. I briefly sketch the received metaphysical foundations of the modern world view, set out a historical outline of an emerging ecological world view, and identify its principal metaphysical implications. Among these the most salient are a field ontology, the ontological subordination of matter to energy, internal relations, and systemic (as opposed to oceanic) holism. I treat moral psychology as a special case of the metaphysical implications of ecology. Ecology undermines the concept of a separable ego or social atom and thus renders obsolete any ethics which involves the concepts of "self" and "other" as primitive terms. Callicott is in the department of philosophy, University of Wisconsin-Stevens Point, Stevens-Point, WI. (EE)

Callicott, J. Baird. "Intrinsic Value, Quantum Theory, and Environmental Ethics." Environmental Ethics

7(1985):257-75. The central and most recalcitrant problem for environmental ethics is the problem of constructing an adequate theory of intrinsic value for nonhuman natural entities and for nature as a whole. In part one, I retrospectively survey the problem, review certain classical approaches to it, and recommend one as an adequate, albeit only partial, solution. In part two, I show that the classical theory of inherent value for nonhuman entities and nature as a whole outlined in part one is inconsistent with a contemporary scientific world view because it assumes the validity of the classical Cartesian partition between subject and object which has been overturned by quantum theory. Based upon the minimalistic Copenhagen Interpretation of quantum theory, I then develop a theory of inherent value which does not repose upon the obsolete subject/object and ancillary fact/value dichotomies. In part three, I suggest that a more speculative metaphysical interpretation of quantum theory--one involving the notion of real internal relations and a holistic picture of nature--permits a principle of "axiological complementarity," a theory of "intrinsic"--as opposed to "inherent"--value in nature as a simple extension of ego. Callicott is in the department of philosophy, University of Wisconsin-Stevens Point, Stevens-Point, WI. (EE)

Callicott, J. Baird, "Moral Monism in Environmental Ethics Defended," Journal of Philosophical Research 19(1994):51-60. In dealing with concern for human beings, sentient animals, and the environment, Christopher D. Stone suggests that a single agent adopt a different ethical theory--Kant's, Bentham's, Leopold's--for each domain. But employing Kant's categorical imperative in this case, Bentham's hedonic calculus in that, and Leopold's land ethic in another, a single agent would have either simultaneously or cyclically to endorse contradictory moral principles. Instead, Callicott suggests that different and sometimes conflicting duties are generated by an agent's membership in multiple moral communities. Peter Wenz, Gary Varner, Andrew Brennan, Anthony Weston, and Eugene Hargrove variously misunderstand either what is at issue in the monism versus pluralism debate or Callicott's suggested communitarian alternative to the sort of pluralism that Stone recommends. (v5,#2)

Callicott, J. Baird, "La nature est morte, vive la nature!" Écologie Politique (Paris), No. 7, Été 1993, pp. 73-90. A French translation of an article that appeared first in English in the Hastings Center Report, September-October 1992. (v4,#3)

Callicott, J. Baird. Review of Foundations of Environmental Ethics. By Eugene C. Hargrove. Environmental Ethics 11(1989):169-77.

Callicott, J. Baird, "A Critique of and an Alternative to the Wilderness Idea," Wild Earth 4, no. 4 (Winter 1994-95): 54-59. Wildernesses could be better conceived as managed biosphere reserves. The wilderness idea (1) was conceived to meet human aesthetic and spiritual needs, not as biodiversity reserves; (2) is a defensive, losing strategy, because most of nature has already been developed, nature is at an end; (3) is not an international idea universalizable for all countries; (4) is ethnocentric, because there was no real wilderness even prior to Columbus; native Americans actively managed the landscape; (5) is flawed because nature is not static as envisioned in wilderness; and (6) the idea perpetuates a dichotomy between humans and nature. A better policy is active human management of nature reserves, with illustrations of how this could be so in the Greater Yellowstone Ecosystem.

Immediately following are two replies, the first by Reed Noss, "Wilderness--Now More than Ever," Wild Earth 4, no. 4 (Winter 1994-95):60-63. "Callicott is dead wrong." "Callicott erects a straw man." "No ecologist interprets wilderness in the static, pristine, climax sense that Callicott caricatures it." The second reply is by Dave Foreman, "Wilderness Areas Are Vital," Wild Earth 4(no. 4, Winter 1994-1995):64-69. Callicott's argument "is fraught with mischief, and unschooled in its subject." "Before a respected scholar like Callicott criticizes the Wilderness concept (even from a friendly if disingenuous point of view), he ought to become more familiar with the history of the Wilderness preservation movement." Callicott counter-replies, a "retort," in "Deep Grammar," Wild Earth 5(no. 1, Spring 1995):64-66. Wilderness is a religion and anyone who criticizes it gets jumped on; Callicott argues that we should "abandon the concept of wilderness (with its historicist baggage) for the concept of

biodiversity reserves."

Callicott, J. Baird, "Tertium Organum and Mankind's Role in Future Evolution." Philosophica 39 (1987): 101-112. A minor piece by Callicott, suggesting a new organistic myth of the human place in the world. The world is a product of "emergent evolution," and we humans are the central nervous system. Callicott, J. Baird, Crowder, Larry B., and Mumford, Karen, "Current Normative Concepts in Conservation," Conservation Biology 13(no. 1, 1999):22-35. A plethora of normative conservation concepts have recently emerged, most of which are ill-defined: biological diversity, biological integrity, ecological restoration, ecological services, ecological rehabilitation, ecological sustainability, sustainable development, ecosystem health, ecosystem management, adaptive management, and keystone species are salient among them. These normative concepts can be organized and interpreted by reference to two new schools of conservation philosophy, compositionism and functionalism. The former comprehends nature primarily by means of evolutionary ecology and considers Homo sapiens separate from nature. The latter comprehends nature primarily by means of ecosystem ecology and considers Homo sapiens as part of nature. Biological diversity, biological integrity, and ecological restoration belong primarily in the compositionist glossary; the rest belong primarily in the functionalist glossary. The former set are more appropriate norms for reserves, the latter for areas that are humanly inhabited and exploited. In contrast to the older schools of conservation philosophy, preservationism and resourcism, compositionism and functionalism are complementary, not competitive and mutually exclusive. As the historically divergent ecological sciences--evolutionary ecology and ecosystem ecology--are increasingly synthesized, a more unified philosophy of conservation can be envisioned. Callicott is in philosophy, University of North Texas. Crowder is in zoology, Duke University, Marine Laboratory. Mumford is in Fisheries and Wildlife, University of Minnesota St. Paul.

Callicott, J. Baird, "Can a Theory of Moral Sentiments Support a Genuinely Normative Environmental Ethic?" Inquiry 35(1992):183-198. The conceptual foundations of Aldo Leopold's land ethic are traceable through Darwin to the sentiment-based ethics of Hume. According to Hume, the moral sentiments are universal; and, according to Darwin, they were naturally selected in the intensely social matrix of human evolution. Hence they may provide a "consensus of feeling," functionally equivalent to the normative force of reason overriding inclination. But then ethics, allege Kristin Shrader-Frechette and Warwick Fox, is reduced to a description of human nature, and the question remains open whether one really ought or ought not value, approve, or do this or that. The moral sentiments, however, are informed by culture. Specific ethical injunctions, even so, are not culturally relative, because cultural beliefs are amenable to cognitive criticism. New experience and new discoveries of science may bring to light hitherto unrecognized "proper objects" of our moral sentiments. This paper was originally delivered at the Pacific Division, APA, March 1991. Callicott is professor of philosophy, University of Wisconsin, Stevens Point. (v3,#3)

Callicott, J. Baird, "The Pragmatic Power and Promise of Theoretical Environmental Ethics: Forging a New Discourse," Environmental Values 11(2002):3-25. Pragmatist environmental philosophers have (erroneously) assumed that environmental ethics has made little impact on environmental policy because environmental ethics has been absorbed with arcane theoretical controversies, mostly centered on the question of intrinsic value in nature. Positions on this question generate the allegedly divisive categories

of anthropocentrism/nonanthropocentrism, shallow/deep ecology, and individualism/holism. The locus classicus for the objectivist concept of intrinsic value is traceable to Kant, and modifications of the Kantian form of ethical theory terminate in biocentrism. A subjectivist approach to the affirmation of intrinsic value in nature has also been explored. Because of the academic debate about intrinsic value in nature, the concept of intrinsic value in nature has begun to penetrate and reshape the discourse of environmental activists and environmental agency personnel. In environmental ethics, the concept of intrinsic value in nature functions similarly to way the concept of human rights functions in social ethics. Human rights has had enormous pragmatic efficacy in social ethics and policy. The prospective adoption of the Earth Charter by the General Assembly of the United Nations may have an impact on governmental environmental policy and performance similar to the impact on governmental social policy and behavior of the adoption by the same body in 1948 of the Universal Declaration of Human Rights. Belatedly, but at last, the most strident Pragmatist critics of the concept of intrinsic value in nature now acknowledge its pragmatic power and promise. (EV)

Callicott, J. Baird, "La Nature est Morte; Vive la Nature," Hastings Center Report 22 (September-October 1992):16-23. "The old, mechanistic idea of nature is dying. We are witnessing the shift to a new idea, in which nature is seen as an organic system that includes human beings as one of its components rather than as brutal and ultimately self-defeating conquistadores." "We are animals ourselves, large omnivorous primates, very precocious to be sure, but just big monkeys, nevertheless. We are therefore a part of nature, not set apart from it. Chicago is no less a phenomenon of nature than is the Great Barrier Reef." Callicott is in the Department of Philosophy, University of Wisconsin, Stevens Point. (v3,#3)

Callicott, J. Baird. "Traditional American Indian and Western European Attitudes toward Nature: An Overview." Environmental Ethics 4(1982):293-318. A generalized traditional Western world view is compared with a generalized traditional American Indian world view in respect to the practical relations implied by either to nature. The Western tradition pictures nature as material, mechanical, and devoid of spirit (reserving that exclusively for humans), while the American Indian tradition pictures nature throughout as an extended family or society of living, ensouled beings. The former picture invites unrestrained exploitation of nonhuman nature, while the latter provides the foundations for ethical restraint in relation to nonhuman nature. This conclusion is defended against disclaimers by Calvin Martin and Tom Regan. Callicott is in the department of philosophy, University of Wisconsin-Stevens Point, Stevens-Point, WI. (EE)

Callicott, J. Baird. "Silencing Philosophers: Minter and the Foundations of Anti-foundationalism." Environmental Values 8(1999):499-516. ABSTRACT: In "No Experience Necessary: Foundationalism and the Retreat from Culture in Environmental Ethics", Ben A. Minter forgivably misconstrues my critique of moral pluralism. Contrary to Minter's representation: I do not accuse moral pluralists of "moral promiscuity"; nor do I posit a "master principle" to govern all human action respecting the environment; and although I offer conceptual foundations for environmental ethics, I do not claim that they rest on certain, a priori, and non-empirical intuitions. Rather, the conceptual foundations I offer for environmental ethics are largely scientific. Contrary to Minter's representation: I do consider a multiplicity of contexts in which ethical actions are situated; and I do respectfully attend to and creatively engage a variety of cultural points of view, both western and nonwestern, in constructing environmental ethics. Anti-foundationalists, such as Minter and Bryan G. Norton, ironically pose an insidious threat to democratic discussion and debate of environmental values, because they themselves posit, but do not frankly acknowledge, foundational beliefs. KEYWORDS: Foundationalism, anti-foundationalism, environmental ethics, pragmatism, culture. J. Baird Callicott, Department of Philosophy and Religion Studies University of North Texas Denton, TX 76203, USA. (EV)

Callicott, J. Baird, "Intrinsic Value, Quantum Theory, and Environmental Ethics," Environmental Ethics 7(1985):257-275. This is the latest in a series of articles that attempt to delineate the concept of intrinsic

value in nature. Callicott rightly sees this as the central problem for environmental ethics. He further develops his axiological subjectivism of Humean/ Darwinian empathy to take into account the revelations of quantum physics. That science has effectively ended the duality of subject/object--thus making the conflict between subjectivism and naturalism a moot point. In ethics, this means that we can value nature as part of an expanded concept of self. What Callicott has done is develop a Deep Ecology position, but rather than basing his conclusions on some kind of mystical intuition, he has grounded his position in coherent and relevant arguments. But in practical terms, it is unclear how far the extension of "self" can reach. (Katz, Bibl # 1)

Callicott, J. Baird, "The Case Against Moral Pluralism," Environmental Ethics 12(1990):99-124. A critique of pluralism and deconstruction as applied to environmental ethics, as seen in the writings of Christopher Stone and Jim Cheney. Callicott argues that the main problem with pluralism is the separation of ethics from metaphysics. Each ethical view is based on a specific metaphysical world-view, so how is pluralism possible? Pluralism abandons the attempt to develop a coherent vision of the world. Callicott proposes the community model of Darwin and Leopold, which presents a univocal ethical theory with multiple duties. In practical operation, Callicott's Darwinian metaphysic of morals is not any less pluralistic than Stone's view. (Katz, Bibl # 2)

Callicott, J. Baird., In Defense of the Land Ethic: Essays in Environmental Philosophy. Albany: SUNY Press, 1989. Pp. x, 325. Callicott is a central figure in environmental ethics, and this is a collection of his principal articles published over the last fifteen years. All of the chapters appeared before 1988, and many of them are reviewed in the first version of this bibliography. Callicott is primarily known as a critic of "animal liberation" and a defender of an extreme holism, but his best work (represented here) involves the development of a foundation for environmental ethics based on Humean psychology, Darwinian evolution, and quantum physics. (Katz, Bibl # 2)

Callicott, J. Baird, ed. Companion to A Sand County Almanac. Reviewed in Environmental Ethics 10(1988):169-76.

Callicott, J. Baird, ed., Companion to A Sand County Almanac: Interpretive and Critical Essays. Madison: University of Wisconsin Press, 1987. Pp. x, 308. This is the first collection of essays devoted exclusively to Aldo Leopold's A Sand County Almanac (Oxford 1948). Leopold is the most influential historical source in the field of environmental ethics; his essay, "The Land Ethic," in Almanac is almost universally cited by environmental philosophers. The essays here range from personal biographical accounts of Leopold to general philosophical discussions of his ideas. Of chief philosophical interest are: Holmes Rolston, "Duties to Ecosystems," (pp. 246-274), which presents a detailed analysis of the reasons why environmental systems can be the objects of moral concern. Ecosystemic communities should not be thought of as organismic individuals. The model of individualism in moral thinking may be appropriate for culture (interhuman activity) but it fails as a model when applied to human-nature interaction. "The appropriate unit for moral concern is the fundamental unit of development and survival," i.e., the ecosystemic community (p. 258). Ecosystemic communities are not analogues of human communities, mainly because the elements of natural communities lack subjectivity; nonetheless, they still have value in themselves. J. Baird Callicott, "The Land Aesthetic" (pp. 157-171), shows how Leopold's aesthetic view of nature was "informed by ecological and evolutionary natural history" (p. 168), so that one ascribes beauty to land that is functioning as a natural ecosystem, not to land that is "pretty" in a merely scenic sense. For Leopold, both moral and aesthetic value are based on ecological relationships. In "The Conceptual Foundations of the Land Ethic" (pp. 186-217), Callicott shows the internal development and logic of Leopold's argument (which is often misunderstood) as being based on: a Darwinian natural history of ethical development, a kinship theory of ethical ties among living things, and an ecological model of biological communities, "all overlaid on a Humean-Smithian moral psychology" (p. 195). Callicott resolves problems of the holism of Leopold's ethic--in particular, the charges that ecological

holism is a kind of "ecofascism," and that the land ethic is just a form of enlightened species-wide human self-interest. The land ethic does not "cancel human morality" (p. 208). It supplements it. And the land ethic is not prudential-consequentialist; it is a deontological system of ethics based on love and respect for the community of the land. In "Aldo Leopold's Intellectual Heritage," (pp. 63-88), Roderick Nash shows that Leopold's land ethic was not entirely original; it has intellectual roots in Darwin, the humane movement regarding animal welfare, and the "reverence-for-life" ethic of Albert Schweitzer. But Nash misses the point of Leopold's originality. The land ethic was holistic; it is based on the community of the ecosystem, not isolated individuals. This was a view that was radical and new. Peter A. Fritzell, "The Conflicts of Ecological Conscience," (pp. 128-153), presents a literary and philosophical exegesis of the Almanac which reveals the basic tensions and paradoxes of conceiving man as both part of the natural community and as part of a moral culture. The collection also contains several worthwhile literary essays on the development of the Almanac and "The Land Ethic," as well as an earlier Foreword written by Leopold in 1947 but not published in the final version of the first edition. No bibliography. (Katz, Bibl # 1)

Callicott, J. Baird, "Genesis and John Muir." ReVision 12:3 (Winter 1990): 31-47. Using an interpretation of Genesis by John Muir as a starting point, Callicott examines the possible presence of a "citizenship" model for human-nature relationships in the Hebrew Bible. The analysis is based on the recognition that Genesis had several authors; Callicott uses the "J" version of creation as his primary source and argues that anthropocentrism was original sin. Another version of this article appears in Environmental History Review 14:1-2 (1990): 65-90. (Katz, Bibl # 2)

Callicott, J. Baird, and Mumford, Karen. "Ecological Sustainability as a Conservation Concept," Conservation Biology 11(no.1, 1997):32. Neither the classic resource management concept of maximum sustainable yield nor the concept of sustainable development are useful to contemporary, nonanthropocentric, ecologically informed conservation biology. As an alternative, we advance an ecological definition of sustainability that is in better accord with biological conservation: meeting human needs without compromising the health of ecosystems. In addition to familiar benefit-cost constraints on human economic activity, we urge adding ecological constraints. Projects are not choice-worthy if they compromise the health of the ecosystems in which human economic systems are embedded. Sustainability, so defined, is offered as an approach to conservation that would complement wildlands preservation for ecological integrity, not substitute for wildlands preservation. Callicott is in philosophy at the University of North Texas. Mumford is in the Department of Fisheries and Wildlife, University of Minnesota, St. Paul. (v8,#2)

Callicott, J. Baird, "Genesis Revisited: Murian Musing on the Lynn White, Jr., Debate," Environmental History Review 14(1990):65-90. The roots of the ecological crisis are as Greek as they are Hebrew. John Muir read Genesis with neither the despotic (subdue and conquer) nor the stewardship model, but rather with an ecocentric-bioegalitarian model. This is not the perspective of the first creation story (the P-account), but it is the perspective of the second creation story (the J-account). Though second in the biblical text, this is the earlier Hebrew account, an atavistic account that sees anthropocentrism as the original sin. Muir's own lifestyle was of this kind. Persons in contemporary society, however, since they have fallen into this anthropocentrism, cannot realistically undertake such a primitive return to nature. But they can perhaps reach a Self-realization, an ecological self (in the sense advocated by Naess) that does transcend anthropocentrism. (v1,#3)

Callicott, J. Baird, "Agroecology in Context", Journal of Agricultural Ethics 1(1988):3-9. Agriculture and medicine palpably manifest a culture's world view. Correspondingly, changes in agriculture and medicine may be barometers of change in a culture's overall outlook. Agroecology translates this abstract new vision into a concrete agricultural vocabulary: The farmstead is regarded as an artificial ecosystem with a multiplicity of diverse plant and animal constituents interacting with one another and with environing natural ecosystems in complex and mutually supporting ways. Callicott is in philosophy at the University of Wisconsin, Stevens Point.

Callicott, J. Baird. "Rolston on Intrinsic Value: A Deconstruction." Environmental Ethics 14(1992):129-43. Central to Holmes Rolston's Environmental Ethics is the theoretical quest of most environmental philosophers for a defensible concept of intrinsic value for nonhuman natural entities and nature as a whole. Rolston's theory is similar to Paul Taylor's in rooting intrinsic value in conation, but

dissimilar in assigning value bonuses to consciousness and self-consciousness and value dividends to organic wholes and elemental nature. I argue that such a theory of intrinsic value flies in the face of the subject/object and fact/value dichotomies of the metaphysical foundations of modern science--a problem Rolston never directly confronts. The modern scientific world view is obsolete. A post-modern scientific world view provides for a range of potential values in nature actualizable upon interaction with consciousness. The best that a modern scientific world view can provide are subject-generated--though not necessarily subject-centered--values in nature. Callicott is in the department of philosophy, University of Wisconsin-Stevens Point, Stevens-Point, WI. (EE)

Callicott, J. Baird and Eugene C. Hargrove. "Leopold's 'Means and Ends in Wild Life Management': A Brief Commentary." Environmental Ethics 12(1990):333-37. Leopold's lecture at Beloit College provides an important glimpse into his conversion from a philosophy of prudent scientific resource management to a land ethic and aesthetic. Leopold here advocates natural regulation not simply because of his growing concern that invasive management principles are limited, but also because of aesthetic considerations that were independent of his instrumental or "utilitarian" training at the Yale Forest School and in the U.S. Forest Service. The lecture is helpful in correcting an unfortunate misreading of Leopold's famous essay, "The Land Ethic," according to which the land ethic is interpreted as being based primarily on human welfare and self-interest. Callicott is in the department of philosophy, University of Wisconsin-Stevens Point, Stevens-Point, WI. Hargrove is in the department of philosophy, University of North Texas, Denton, Texas. (EE)

Callicott, J. Baird, "A Brief History of the American Land Ethic Since 1492," Inner Voice (Association of Forest Service Employee's for Environmental Ethics), vol. 6, no. 1 (January-February 1994). Callicott teaches philosophy at the University of Wisconsin, Stevens Point. (v5,#1)

Callicott, J. Baird, "Whither Conservation Ethics? in Conservation Biology vol. 4, no. 1 (March 1990):15-20. Callicott concludes that Leopold advocated "active management for a mutually beneficial human-nature symbiosis, in addition to passive preservation of 'wilderness.'" As the human population grows and more nations develop, the best hope for conservation biology lies in a generalization of Leopold's ideal of ecosystems which are at once economically productive and ecologically healthy. The principal intellectual challenge raised by such an ideal for conservation biology is the development of criteria of ecological health and integrity in an inherently dynamic, evolving, and human-saturated biota."

Callicott, J. Baird, "How Environmental Ethical Theory May Be Put into Practice," Ethics and the Environment 1(no.1, 1996):3-14. Environmentalists do not appear to walk their walk as consistently as animal liberationists and anti-abortionists. Are we therefore more hypocritical? Maybe: but there's another explanation. Unlike concern for individual animals or individual fetuses, environmental concerns are holistic (systemic)--air and water pollution, species extinction, diminished ecological health and integrity. One pro-life pregnant woman may preserve the life of one unborn baby, the one in her uterus; and one animal liberationist can save the life of one animal, the one he didn't eat. But one environmentalist who refuses to own and operate an automobile has no measurable effect on air pollution. Only collective, social change--universal banning of automobiles, mandatory recycling, etc.--will effectively redress environmental insults. Thus, the best way to put environmental ethics into practice is not to try to do one's bit and hope that all such individual environmental ethical acts will aggregate into significance. The best way to put environmental ethics into practice is to work to instill environmental values in society as the foundation for coercive environmental policies, regulations, and laws. The mechanistic-materialistic worldview and its associated consumerist value system trickled down into the collective consciousness via its technological manifestation in a plethora of machines. The systemic worldview in which environmental values are embedded may be communicated to the general public less

by means of discursive discourse than by a new generation of systemic-electronic technologies. Callicott teaches philosophy at the University of North Texas, Denton. (E&E)

Callicott, J. Baird, "The Search for an Environmental Ethic," in Tom Regan, ed., Matters of Life and Death: New Introductory Essays in Moral Philosophy, 3rd edition (New York: McGraw Hill, 1993). Earlier editions were in 1980 and 1986, first published by Random House and Temple University Press. The version in the 3rd edition is the most up-to-date.

Callicott, J. Baird, "Non-anthropocentric Value Theory and Environmental Ethics." American Philosophical Quarterly 21 (1984): 299-309. Callicott's interest in developing a non-anthropocentric axiology as the basis for an environmental ethic leads him to David Hume's theory of moral sentiments, now seen as an expression of evolutionary development. A blending of the thought of Hume, Darwin, and Aldo Leopold. Humans develop a feeling of value for the nonhuman world due to a misplaced biological altruism. (Katz, Bibl # 1)

Callicott, J. Baird. "Moral Monism in Environmental Ethics Defended." Journal of Philosophical Research 19 (1994): 51-60. "In dealing with concern for fellow human beings, sentient animals, and the environment, Christopher D. Stone suggests that a single agent adopt a different ethical theory--e.g. Kant's, Bentham's, Leopold's--for each domain. Ethical theories, however, and their attendant rules and principles are embedded in moral philosophies. Employing Kant's categorical imperative in this case, Bentham's hedonistic calculus in that, and Leopold's land ethic in another, a single agent would therefore have either simultaneously or cyclically to endorse contradictory moral philosophies. Instead, I suggest that different and sometimes conflicting duties and obligations are generated by an agent's membership in multiple moral communities. Peter Wenz, Gary Varner, Andrew Brennan, Anthony Weston, and Eugene Hargrove, among others, variously misunderstand either what is at issue in the monism versus pluralism debate in environmental ethics or my suggested communitarian alternative to the sort of pluralism that

Stone recommends." Callicott is in philosophy at the University of North Texas. (v7, #3)

Callicott, J. Baird, "Animal Liberation and Environmental Ethics: Back Together Again." Between the Species 4 (1988): 163-169. An attempt to reconcile these two philosophical movements through the notions of community and sympathy---but this reconciliation tends to eliminate Callicott's most famous position, the lack of value of domesticated animals. (Katz, Bibl # 2)

Callicott, J. Baird, "The Search for an Environmental Ethic," pages 322-382 in Tom Regan, ed., Matters of Life and Death: New Introductory Essays in Moral Philosophy, 3rd ed. New York: McGraw Hill, 1993. A useful general introduction, written for freshmen and sophomores. Callicott analyzes the need for an environmental ethic, anthropocentric versus nature-based ethics, deep ecology (especially Naess), ecofeminism, the criteria for an adequate environmental ethics, two versions of a Judeo-Christian environmental ethics, the need for an evolutionary and ecologically based ethics, and then several accounts of an expanding ethics: animal welfare/rights ethics (Singer and Regan), biocentrism (Goodpaster, Taylor, Rolston), and concluding with his own recommendation, ecocentrism (Leopold, Callicott, Rolston). The revision in the third edition is more current than earlier editions. Callicott is in philosophy at the University of North Texas.

Callicott, J. Baird, "Environmental Ethics" in Lawrence C. Becker and Charlotte B. Becker, eds., Encyclopedia of Ethics, in 2 vols, Vol. I, A-K (New York: Garland Publishing Co., 1992), pages 311-315.

Callicott, J. Baird. "The Value of Ecosystem Health." Environmental Values 4(1995):345-361. The concept of ecosystem health is problematic. Do ecosystems as such exist? Is health an objective condition of organisms or is it socially constructed? Can 'health' be unequivocally predicated of ecosystems? Is ecosystem health both objective and valuable? Are ecosystem health and biological integrity identical? How do these concepts interface with the concept of biodiversity? Ecosystems exist, although they are turning out to be nested sets of linked process-functions with temporal boundaries, not tangible superorganisms with spatial boundaries. Ecosystem health--or normal occurrence of ecological processes and functions--is an objective condition of ecosystems, although the concept of ecosystem health allows some room for personal and social determination or construction. Ecosystem health is prudentially, aesthetically, and intrinsically valuable, although the value of ecosystem health is subjectively conferred. Biodiversity and biological integrity are different from, but not unrelated to, ecosystem health. Together these three normative concepts represent complementary conservation goals. KEYWORDS: Biodiversity, community, ecosystem, ecosystem health, health, integrity, objective, subjective, value. Callicott is in the philosophy and religious studies department, University of North Texas. (EV)

Callicott, J. Baird, "American Indian Land Ethics," Environmental Ethics 18(1996):438. Reply to Kaufman, Frederick, who claims that the Native American environmental ethic differs from Aldo Leopold's land ethic. In form, though not in content, the Ojibwa land ethic and the Aldo Leopold land ethic are identical. (EE)

Callicott, J. Baird, "On Norton and the Failure of Monistic Inherentism," Environmental Ethics 18(1996):219-221. Norton misrepresents Callicott's arguments. Further, Norton's campaign to make people believe that Aldo Leopold was a weak anthropocentrist is prosecuted by means of text torturing. (EE)

Callicott, J. Baird, Beyond the Land Ethic. Albany, NY: SUNY Press, 1999. A sequel to In Defense of the Land Ethic (SUNY Press, 1989). This compilation collects many of the author's scattered journal articles and book chapters published in the intervening decade. An introduction locates environmental ethics in the wider discipline of philosophy and sets each item in the collection in its context. Contents:

1. Introduction: Compass Points in Environmental Philosophy
- I. Practicing Environmental Ethics
 2. Environmental Philosophy Is Environmental Activism: The Most Radical and Effective Kind
 3. How Environmental Ethical Theory May Be Put Into Practice
 4. Holistic Environmental Ethics and the Problem of Ecofascism
- II. The Conceptual Foundations of the Land Ethic Revisited
 5. Just the Facts, Ma'am
 6. Can a Theory of Moral Sentiments Support a Genuinely Normative Environmental Ethic?
 7. Do Deconstructive Ecology and Sociobiology Undermine the Leopold's Land Ethic?
- III. Moral Monism vs. Moral Pluralism
 8. The Case Against Moral Pluralism
 9. Moral Monism in Environmental Ethics Defended
- IV. Nature's Intrinsic Value
 10. Genesis and John Muir
 11. Rolston on Intrinsic Value
 12. Intrinsic Value in Nature: A Metaethical Analysis
- V. Ecological Metaphysics in Agriculture, Medicine, and Technology
 13. The Metaphysical Transition in Farming: From the Newtonian-Mechanical to the Eltonian-Ecological
 14. Environmental Wellness
 15. After the Industrial Paradigm, What?
- VI. Toward a New Philosophy of Conservation
 16. Whither Conservation Ethics?
 17. Aldo Leopold's Concept of Ecosystem Health
 18. The Value of Ecosystem Health
 19. Ecological Sustainability as a Conservation Concept

Callicott is in philosophy at the University of North Texas, and is president of ISEE. (v.9,#4)
 Callicott, J. Baird, "Do Deconstructive Ecology and Sociobiology Undermine Leopold's Land Ethic?," Environmental Ethics 18(1996):353-372. Recent deconstructive developments in ecology (doubts about the existence of unified communities and ecosystems, the diversity-stability hypothesis, and a natural homeostasis or 'balance of nature'; and an emphasis on 'chaos,' 'perturbation,' and directionless change in living nature) and the advent of sociobiology (selfish genes) may seem to undermine the scientific foundations of environmental ethics, especially the Leopold land ethic. A reassessment of the Leopold land ethic in light of these developments (and vice versa) indicates that the land ethic is still a viable environmental ethic, if judiciously updated and revised. Callicott is in philosophy, University of North Texas, Denton. (EE)

Callicott, J. Baird, Earth's Insights: A Survey of Ecological Ethics from the Mediterranean Basis to the Australian Outback. Berkeley: University of California Press, 1994. 261 pages. \$ 35.00, cloth only. A comparative environmental ethics, the first book-length systematic study by Callicott, whose numerous articles (including those collected into In Defense of the Land Ethic) have made him internationally known as the principal philosophical interpreter of Aldo Leopold's land ethic. Here we have Callicott looking around the globe for insights, modern, classical, ancient, East and West, indigenous, and, finally, postmodern. Chapter 1. The Notion of and Need for Environmental Ethics (including comparative environmental ethics and the One-Many problem). Chapter 2. Western European Historical Roots (Judeo-Christian, Graeco-Roman, Islam, Gaia Redux). Chapter 3. South Asia (Hinduism, Jainism, Buddhism). Chapter 4. Traditional East Asia (Taoism, Confucianism). Chapter 5. East Asian Buddhism (Hua-yen, Tendai and Shingon, Zen, The Japanese and the Environment: A paradox). Chapter 6. Far

Western (Polynesian Paganism, American Indian Land Wisdom). Chapter 7. South American Eco-Eroticism. Chapter 8. African Biocommunitarianism and Australian Dreamtime. Chapter 9. A Postmodern Evolutionary-Ecological Environmental Ethic (Science, Postmodernism, Natural History, Leopold's Land Ethic). Chapter 10. Traditional Environmental Ethics in Action (Stewardship, Hindus, Buddhists, with examples such as the Sri Lanka Sarvodaya Movement and Buddhist Forest Conservation in Thailand). Wide-ranging, comprehensive, and an important contribution toward the possibility of global environmental ethics. Callicott is professor of philosophy at the University of Wisconsin, Stevens Point. Reviewed by Mary Evelyn Tucker in Environmental Ethics 17(1995):321-325. (v5,#3)

Callicott, J. Baird, Crowder, Larry B., and Mumford, Karen, "Normative Concepts in Conservation Biology: Reply to Willers and Hunter," Conservation Biology 14 (No. 2, 2000 Apr 01): 575- . (v.11,#4)

Callicott, J. Baird, "Harmony between Men and Land--Aldo Leopold and the Foundations of Ecosystem Management," Journal of Forestry 98 (No. 5, 2000 May 01): 4- . Essays published only recently reveal that formulating a concept of ecosystem health--"land health," as he called it--was central to Aldo Leopold's philosophy of conservation. Our contemporary concepts of ecosystem health and ecosystem management were, in fact, clearly outlined in Leopold's writings 50 years ago. (v.11,#4)

Callicott, J. Baird. "Many Indigenous Worlds or the Indigenous World? A Reply to My 'Indigenous' Critics." Environmental Ethics 22(2000):291-310. Earth's Insights is about more than indigenous North American environmental attitudes and values. The conclusions of Hester, McPherson, Booth, and Cheney about universal indigenous environmental attitudes and values, although pronounced with papal infallibility, are based on no evidence. The unstated authority of their pronouncements seems to be the indigenous identity of two of the authors. Two other self-identified indigenous authors, V. F. Cordova and Sandy Marie Angl s Grande, argue explicitly that indigenous identity is sufficient authority for declaring what pre-Columbian indigenous environmental attitudes and values were. Exclusive knowledge claims based on essentialist racial-cultural identity, though politically motivated, are politically risky. They may inadvertently legitimate more noxious and dangerous racial-cultural identity politics and exclusion of those who identify themselves (or are identified by others) in oppositional racial-cultural terms from full and equal participation in the political and economic arenas of the prevailing culture. Biologically, racial differences are entirely superficial; Homo sapiens is a single, homogeneous species. Contrary to Hester et al., ethnic conflict was common among pre-Columbian indigenous North American peoples. Other indigenous authors, among them McPherson, have found my comparison of pre-Columbian indigenous North American attitudes and values with the Aldo Leopold land ethic to be illuminating. I wish I had not said that pre-Columbian indigenous North American attitudes and values are "validated" by ecology, but rather that they and ecology are "mutually validating." (EE)

was in 1992.

Callicott, J. Baird, "Choosing Appropriate Temporal and Spatial Scales for Ecological Restoration," Journal of Biosciences 27(no. 4, Suppt 2, 2002):409-420. Ecological restoration classically seeks a balance of nature. Human disturbance is regarded as unnatural and in the Western Hemisphere started with the Europeans. Restoration may seek a pre-settlement state. But the new ecology finds nature always in flux; moreover human disturbance in the New World goes back 10,000 years. Some wish to restore conditions at the Pleistocene-Holocene boundary, even restoring the fauna from that time, so far as possible. But with the choice of appropriate temporal and spatial scales for ecological restoration, one can still make a scientifically defensible case for restoration to pre-settlement conditions. Post-settlement conditions greatly exceeded earlier aboriginal influences, nor does one have to claim that such pre-settlement conditions were in equilibria. Callicott is in philosophy, University of North Texas.

Callicott, J. Baird "What 'Wilderness' in Frontier Ecosystems?" *Environmental Ethics* 30(2008):235-249. Wilderness, for seventeenth-century Puritan colonists in America, was hideous and howling. In the eighteenth century, Puritan preacher and theologian, Jonathan Edwards, began the process of transforming the American wilderness into an aesthetic and spiritual resource, a process completed in the nineteenth century by Ralph Waldo Emerson. Henry David. Thoreau was the first American to recommend wilderness preservation for purposes of transcendental recreation (solitude, and aesthetic and spiritual experience). In the twentieth century, Theodore Roosevelt and Aldo Leopold advocated wilderness preservation for a different kind of recreation (hunting, fishing, and primitive travel) in order to preserve the putatively unique American character and institutions. Of these three historic conceptions of wilderness preservation, the third is the best model for frontier ecosystems at the austral tip of the Americas. (EE)

Campagna, Claudio, and Teresita Fernandez, "A Comparative Analysis of the Vision and Mission Statements of International Environmental Organisations," Environmental Values 16(2007):369-398. The vision and mission statements of 24 environmental organisations were analysed under the premise that the language used in these statements reflects and influences the priorities of their operation. A dominant perspective, hinging on the concept of 'sustainable development', merged the profile of government agencies and non-governmental groups. The language reflected an utilitarian ethics: the environment was more generally portrayed as resources than as nature. Aesthetic remarks were exceptional, even among groups focusing on wildlife. Despite a broadly claimed link between human welfare and habitat viability, environmental issues were not broadly referred to by humanitarian organisations, while conservation groups comply with societal priorities and needs. Organisational statements seem more concerned about political legitimisation by audiences with specific expectations than about articulating purposes with internal structural consequences or goals that advocate change or reflect organisational uniqueness. The authors are at the Centro Nacional Patagónico, Chubut, Argentina.

Campbell, Martha, John Cleland, Alex Ezeh, and Ndola Prata. "Return of the Population Growth Factor." *Science*, Vol. 315, no. 5818 (16 March 2007): 1501-02. Between 2005 and 2050, the world population is projected to grow by 2.6 billion a number roughly equal to the total global population in 1950. Decisions made now can influence the growth rate. Some nations have some success; most do not. In 1950 Sri Lanka had the same population as Afghanistan, but Sri Lanka implemented a realistic set of fertility regulation choices and as a result will have one-quarter of the population of Afghanistan a century later. In 1970, there were 5 million more people in Bangladesh than Pakistan, but Bangladesh focused on making family planning available in culturally acceptable ways, while Pakistan did not. As a result, by 2050 Pakistan will have 62 million more people than Bangladesh. Sir David King notes that "the massive growth in the human population through the 20th century has had more impact on biodiversity than any other single factor."

Campbell, Mora, Review of Michael W. Fox, Agricide: The Hidden Farm and Food Crisis That Affects Us All. Malabar, FL: Krieger Publishing Company, 1996. pp. 252. Journal of Agricultural and Environmental Ethics 10(1997/1998):200-203. Campbell is at York University.

Campbell, Mora, "Beyond the Terms of the Contract: Mothers and Farmers", Journal of Agricultural and Environmental Ethics 7(1994):205-220. At the heart of the recent Canadian agricultural policy review, "Growing Together", is the concept of partnership. The formation of partnerships between various members of the agri-food sector, it is claimed, will provide a framework in which all parties will benefit. I describe the contractarian assumptions inherent in this proposal, and show how their application jeopardizes the economic survival and values of many household farmers. Drawing on the work of philosophers Virginia Held and Sara Ruddick, I outline strong connections between the practices of mothering persons and household farmers, arguing that the values arising out of the practice of household farming are best articulated under a feminist ethic of care. I conclude that agricultural ethics must be contextualized to encompass all of the moral relations in agriculture. Campbell is in environmental studies, York University, New York, Ontario.

Campbell, Robert A., "A Narrative Analysis of Success and Failure in Environmental Remediation: The Case of Incineration at the Sydney Tar Ponds", Organization and Environment, 15, (No. 3, 2002): 259-77. In this article, the author constructs a sociological narrative as a means of describing and analyzing a project to incinerate an estimated 700,000 tonnes of toxic sludge created as a by-product of a century of steel making in Sydney, Nova Scotia, Canada. On one level, the author's objective here is to document some of the events that have taken place at what is considered one of the worst toxic sites in Canada. On another level, though, the author attempts to outline a method through which we may better understand the dynamics of environmental movements. Specifically, in this case, the author uses a multidimensional conceptualization of success and failure that includes scientific, technological, economic, political, social and cultural components. Campbell is a senior lecturer in sociology at the Scarborough campus of the University of Toronto.

Campbell SueEllen, Even Mountains Vanish: Searching for Solace in an Age of Extinction. Salt Lake City: University of Utah Press, 2003. Campbell faces a paradox: whenever she contemplates the beauty of the cosmos and the astonishing inventiveness of nature she encounters the deleterious environmental impact of humankind. Campbell describes a visit to Pajarito Canyon, a wilderness area just outside Los Alamos, and her sudden need to understand more about Earth's improbable evolution. Campbell invokes plate tectonics, sandhill cranes, Pueblo cultures, nuclear waste, even a flash flood that inundates her university's library. Rocky Mountain National Park and Canada's Arctic coast. Campbell is beset with ecological and spiritual blues, ponders the survival strategies of tundra plants, animals, and people. She struggles with human destructiveness and the transitoriness of life. Campbell teaches English and nature writing at Colorado State University.

Campbell SueEllen. Bringing the Mountain Home. Tucson: University of Arizona Press, 1997. "The desire for wildness is an elemental force, like gravity, like magnetism." "A deeply loved landscape holds us fast to the planet. Drawn to one wild place, to a small lily-splashed lake in the Rockies, I'm drawn to all wild places." A narrative of what landscape means to the author, recalling especially her walks in the Rockies. "I realized I was taking two walks at once." "One was intensely personal and immediate, my body, senses, memories moving through a specific and extraordinary place and moment. The other was shared, my own experience formed by my culture, by other, earlier visitors to wild places, by circumstances, attitudes, assumptions, words, even emotions I had no part in creating but had somehow absorbed myself." Campbell teaches English at Colorado State University. (v8,#1)

Campos, Daniel G. "Assessing the Value of Nature: A Transactional Approach." Henry David Thoreau's discussion of the highest value of wild apples and my own reflection upon my experience, interacting with the sea and enjoying its products during my Central American upbringing, motivate this discussion of how human beings may apprehend nature's highest worth. I propose that in order to apprehend nature's highest value it is necessary to understand the complete transaction between human beings and nature—an active transaction that requires from the human being a continuous movement along experience, reflection, and responsible action. I argue that the economic valuation of natural products—via the contemporary economic concepts of utility, use-value, existence-value, and willingness-to-pay—is insufficient to comprehend the full worth of nature because it reduces the human being-nature transaction to mere economic terms. Hence, a reading of Ralph Waldo Emerson's Nature provides insight into the services—commodity, beauty, language, and discipline—that the human being receives, as part of the transaction, from nature. In turn, a reading of Aldo Leopold's A Sand County Almanac complements the Emersonian position by considering the human being's position as a member of a natural community. Finally, I propose that in order to apprehend the worth of nature, it is further necessary to move from the reflective understanding of the human being-nature transaction into necessary action, that is, into the assumption of responsibility towards nature. Cannavo (Cannavò), Peter F. *The Working Landscape: Founding, Preservation, and the Politics of Place*. Cambridge, MA: The MIT Press, 2007. Analyzes what the author calls a zero-sum conflict between development and preservation, and offers practical and theoretical alternatives to this dead-locked, polarized politics of place. Logging of old-growth forests in the Pacific Northwest, urban sprawl, and the redevelopment of the former site of the World Trade Center in New York City.

Cannavo, Peter F. "American Contradictions and Pastoral Visions: An Appraisal of Leo Marx's 'The Machine in the Garden'", *Organization and Environment* 14 (No. 1, March 2001) pp.74-92. This article discusses the significance of Leo Marx's 1964 "The Machine in the Garden" in environmental studies, and how Marx's ideas have evolved in later essays, noting especially Marx's insight into the contradictory relationship with nature embodied in American pastoralism. Americans celebrate nature and rural values and yet embrace industry and commercialism as means to a pastoral utopia, even though these are ultimately destructive of the natural environment. Given these contradictions, Marx argues that American pastoralism ultimately fails as a viable cultural and political ideal. This article is critical of such pessimism but also shows how Marx revises his prognosis in later essays and comes to see the pastoral ideal, particularly as manifested in environmentalism, as offering a key political alternative to contemporary industrial society and its social and ecological pathologies. Cannavo recently received his PhD in political science from Harvard University. (v.13,#2)

Cannavò, Peter F. *The Working Landscape: Founding, Preservation, and the Politics of Place*. Cambridge, MA: MIT Press, 2007. Cannavò uses case studies of the debate over the logging of old-growth forests in the Pacific Northwest, the problems of urban sprawl, and the redevelopment of the former World Trade Center site in New York to discuss zero-sum conflict between nature preservation versus economic development, resource exploitation, and commodification as a contemporary crisis of place. To resolve this crisis, he offers theoretical and practical alternatives built upon an approach that unifies democratic governance and ecological values and that embraces both change and stability to create a "working landscape" in rural, suburban, and urban areas.

To resolve this crisis, he offers theoretical and practical alternatives built upon an approach that unifies democratic governance and ecological values and that embraces both change and stability to create a "working landscape" in rural, suburban, and urban areas.

Capitalism, Nature, Socialism: A Journal of Socialist Ecology. P.O. Box 8467, Santa Cruz CA 95061. A new journal that began publishing in 1988, with six issues through 1990. The focus is on Marxist and socialist analysis of the ecological and economic crisis. "Even though environmentalism constitutes one of the most powerful social movements in the United States and other countries, and ecological destruction and crises now ravage the world, Marxists and socialists have made few or feeble attempts to theoretically explain these facts in a coherent way." The journal plans to fill this "theoretical void" (CNS, 3, 1989, p. 1). (Katz, Bibl # 2)

Capitalism, Nature, Socialism: A Journal of Socialist Ecology is now in its eighth volume, recently expanded in size. The journal claims still to be "the only serious theoretical and political left green journal in the English-speaking world." It seeks to link the traditional concerns of labor movements with ecological issues and the struggles of new social movements. Sample forthcoming articles: Joan Martinez, "Environmental Justice, Local and Global"; Andrew Light, "Interview with Arne Naess"; Alain Lipietz, "What Is Ecological Marxism?"; Timothy W. Luke, "Nature Protection or Nature Projection: A Cultural Critique of the Sierra Club." The editor is James O'Connor. Published by Guilford Publications, 72 Spring Street, New York, NY 10012. Phone 212/431-9800. Fax 212/966-6708. (v7,#4)

Capitalism, Nature, Socialism: A Journal of Socialist Ecology is the only international theoretical and political journal of socialist ecology, including ecological Marxism and feminism. The July 1991 issue is on red green politics and on science and ecology. U. S. address: Guilford Publications, Journals Department, 72 Spring St., New York, NY 10012. Outside the U.S.: Guilford Press, The Distribution Centre, Blackhorse Rd., Letchworth, Herts, SG6 1HN, UK. (v2,#3)

The data presented are the proceedings of an international symposium held at Skukuza, Kruger National Park, South Africa.

Caputi, Jane, "Green Consciousness: Earth-based Myth and Meaning in Shrek," *Ethics and the Environment* 12(no. 2, 2007):23-44. Green consciousness is a holistic worldview based in many ancient and still-current principles and wisdoms, holistic worldview, and one that offers alternative conceptions of human and non-human subjectivity, of humans' relationships with each other and with non-human nature. Its principles are elaborated not only in environmentalist philosophies but also in some forms of popular culture. Shrek retells ancient earth-based myth, specifically around its imagination of greenness as an emblem of the life force, its respect for the feminine principle, its refusal of hierarchy and split consciousness, its endorsement of the happy body and communal ecstasy, and its ringing celebration of diversity. Caputi is in Women's Studies and Communications, Florida Atlantic University.

Caraco, Nina; Cole, Jonathan; Findlay, Stuart; Wigand, Cathleen, "Vascular Plants as Engineers of Oxygen in Aquatic Systems," BioScience 56 (no.3, March 2006): 219-225 (7). The impact of organisms on oxygen is one of the most dramatic examples of ecosystem engineering on Earth. In aquatic systems, which have much lower oxygen concentrations than the atmosphere, vascular aquatic plants can affect oxygen concentrations significantly. Aquatic plants are generally thought of as adding oxygen to aquatic systems through photosynthesis, but the impact of vascular aquatic plants on oxygen varies greatly with plant morphology. Floating-leaved plants that vent oxygen to the atmosphere can strongly deplete oxygen. In some ecosystems where floating-leaved plants have replaced submersed vegetation, oxygen concentrations have been substantially reduced. This can have cascading impacts on nutrient and trace gas chemistry and on the suitability of plant beds as habitat for animal life.

Caragata, Lea, "New Meanings of Place: The Place of the Poor and the Loss of Place as the Center of Mediation," Philosophy and Geography 3 (1998): 215-237. Caragata is associate professor in community development for the Faculty of Social Work at Wilfrid Laurier University. (P&G)

Card, Claudia, "Environmental Atrocities and Non-Sentient Life," Ethics and the Environment 9(no. 1, 2004):23-45. "I lean toward the even stronger judgment that such culpable omissions and deeds are atrocities also in the sense of evils to a great many kinds of life, including non-sentient nature--plants, species, biotic communities, and ecosystems. But can that intuition be sustained philosophically?" Card is in philosophy, University of Wisconsin. With commentary: Norlock, Kathryn, "The Atrocity Paradigm Applied to Environmental Evils," Ethics and the Environment 9(no. 1, 2004):85-93. (E&E)

Carder, Al C. Forest Giants of the World Past and Present. Markham, Ont: Fitzhenry and Whiteside, 1994. 208pp. \$55 cloth. An authoritative record of the world's super trees, past and present, and other striking and remarkable trees. Covers 140 species. Excellent photographs. The tallest? It's difficult to be sure, because some crowns have broken off, and many of the tallest were cut before reliable records were kept. Principal candidates: Mountain ash, Eucalyptus regnans in Australia; California coastal redwoods, Sequoia sempervirens; Douglas-Fir, Pseudotsuga menziesii, in the Pacific Northwest, all about 400 feet. The oldest? Trees over 1,000 years are difficult to date reliably, often the inner core has rotted. Probably Bristlecone pine, Pinus longaeva, 4,900 years, in the Western United States. In these forest giants "beauty and goodness abide in good measure and will ever-increasingly strengthen, commensurate with time" (p. 169). (v8,#1)

Cardilio, Marcel et al., "Multiple Causes of High Extinction Risk in Large Mammal Species," Science 309(19 August 2005):1239-1241. Many large animal species run a high risk of extinction, commonly thought to relate to large body size, visibility, low rates of reproduction. But these authors find many more contributing factors, both environmental and intrinsic to the morphology and behavior of large animals, such as the need for larger ranges of habitat. The dangers of extinction for large animals are greater than previously recognized. Cardilio is in biology, Imperial College, London.

Care, Norman S. "Future Generations, Public Policy, and the Motivation Problem." Environmental Ethics 4(1982):195-213. A motivation problem may arise when morally principled public policy calls for serious sacrifice, relative to ways of life and levels of well-being, on the part of the members of a free society. Apart from legal or other forms of "external" coercion, what will, could, or should move people to make the sacrifices required by morality? I explore the motivation problem in the context of morally principled public policy concerning our legacy for future generations. In this context the problem raises special moral-psychological difficulties. My inquiry suggests pessimism regarding our ability to solve the motivation problem relative to what morality requires on behalf of future generations. Care is in the department of philosophy, Oberlin College, Oberlin, OH. (EE)

Carey, John, "Where Have All the Animals Gone?" Wildlife 29(1999):12-21. In Bolivia, the Sirono and Yugi people of the Bolivian Amazon are over-hunting the forest to meet their basic needs. Increased use of cars and guns has made them hunt more effectively, with empty forests remaining.

Carey, John, "Where Have All the Animals Gone?" International Wildlife 29 (no. 6, Nov./Dec. 1999):12-

20. Meat for the pot. In many tropical forests around the globe, virtually every animal has been killed, leaving an empty forest. Hunting for the pot is becoming a bigger conservation threat than habitat loss--Laos, Southeast Asia, Indonesia, India, the Brazilian Amazon, the Congo. In some areas biologists can best inventory what is in the forests by walking through the markets. Everything is eaten. Typically national regulation authority is weak, and where wildlife responsibility has been transferred to local peoples, the problem is worse. Sustainability is a myth before the pressures of exploding populations. George Schaller says, "Only people that sit in offices have the romantic notions that local people live in harmony with the environment" (p. 17). There are dozens of contributing factors. Perhaps the major one is logging, when logging roads open up once-remote areas. Carey covers science and technology for Business Week magazine. (v.10,#3)

Carlassare, Elizabeth. "Socialist and Cultural Ecofeminism: Allies in Resistance." Ethics and the Environment 5(2000):89-106. ABSTRACT: Ecofeminism is a social movement and form of theoretical inquiry that resists formations of domination and seeks to construct a politics for planetary survival and social egalitarianism. In the words of Australian ecofeminist Ariel Salleh (1995, 26), "[E]cofeminists are concerned about global Sustainability as much as gender justice." Ecofeminism consists in many different ideas and actions, and as a result cannot be generalized easily. That ecofeminism accommodates a diverse array of perspectives has led some feminists (most notably social ecologist and former ecofeminist Janet Biehl, [Biehl 1991]) to criticize ecofeminism on the basis that it is incoherent. Ecofeminists hold different views on how to effect social change and on the role of Western dualism, capitalism, patriarchy, and imperialism in perpetuating ecological degradation and oppression along multiple lines, including gender, race, and class. Despite this diversity, ecofeminism is united by the commitment of its proponents to planetary survival and ending oppression. In this essay, I explore the differences and common ground between two predominant perspectives in ecofeminism, socialist and

cultural ecofeminism, examining the strategies for social change and epistemological positions that arise from these perspectives. I argue against attempts by feminists and ecofeminists of materialist persuasions to dismiss all or part of ecofeminism on the basis that it is incoherent or regressive, examining the question of who such criticisms serve and suggesting alternative interpretations of ecofeminism's "regressive" moves and "incoherence." I argue that, despite their different views, ecofeminists are able to act together politically in their shared desire to end ecological degradation and foster social egalitarianism. (E&E)

Carlson, Allen, Aesthetics and the Environment: The Appreciation of Nature, Art, and Architecture. London: Routledge, 2000. Carlson's essays on aesthetics and nature, published over two decades, here gathered into book form, with several chapters published for the first time, including cross-referencing and overviews of the field. Carlson is in philosophy, University of Edmonton, Alberta. (v.13,#1)

Carlson, Allen, and Arnold Berleant, eds., The Aesthetics of the Natural Environment. Peterborough, Ontario: Broadview Press, 2004. Contributions by Ronald Hepburn, Allen Carlson, Arnold Berleant, Noël Carroll, Stan Godlovitch, Yuriko Saito, Emily Brady, Marcia Muelder Eaton, Holmes Rolston, III, Cheryl Foster, Ronald Moore, John Andrew Fisher, Donald W. Campbell, Thomas Heyd, and Yrjö Sepänmaa. Designed as an introduction to the present state of the field of environmental aesthetics. Carlson is in philosophy, University of Alberta, Edmonton. Berleant is philosophy (emeritus), Long Island University, C.W. Post Campus. now in Castine, Maine. (v. 15, # 3)

Carlson, Allen, Aesthetics and the Environment: The Appreciation of Nature, Art and Architecture. New York: Routledge, 2003. How much of our aesthetic experience is in response to nature, sunsets, mountains, or horizons, or more mundane surroundings like gardens or the view from our window. Knowledge of what we are appreciating is essential to having an appropriate aesthetic experience and a scientific understanding of nature can enhance our appreciation, rather than denigrate it. Carlson is in philosophy at the University of Alberta.

Carlson, Allen, "Nature and Positive Aesthetics," Environmental Ethics 6(1984):5-34. A consideration of various justifications for the position of "Positive Aesthetics": all of nature untouched by man is beautiful. Carlson supports this view by a comparison of art appreciation with natural science. As natural science informs us of the properties of the ecosystem, we discover its beauty. (Katz, Bibl # 1)

Carlson, Allen, "Is Environmental Art an Aesthetic Affront to Nature?" Canadian Journal of Philosophy

16 (1986): 635-650. Carlson argues that "environmental art"--the earthworks, earthmarks, and large structures erected on natural sites--are an aesthetic indignity to nature itself. Environmental art changes an "object's kind ... thereby altering its aesthetic qualities" (p. 641). The discussion owes much to an article by Peter Humphrey in Environmental Ethics and Donald Crawford, "Nature and Art: Some Dialectical Relationships," Journal of Aesthetics and Art Criticism 42 (1983). (Katz, Bibl # 1)

Carlson, Allen, "Saito on the Correct Aesthetic Appreciation of Nature," Journal of Aesthetic Education 20 (no. 2, 1986):85-93. Saito does not adequately distinguish between a correct and a relevant appreciation of nature. Saito's arguments neither clearly establish the relevance of a variety of possible kinds of aesthetic appreciation of nature nor seriously erode the grounds for the prominence that ought to be granted to scientific categories of nature in this appreciation.

Carlson, Allen, "Nature, Aesthetic Appreciation, and Knowledge," Journal of Aesthetics and Art Criticism 53(1995):393-400. Critiquing the views of Carroll and Godlovitch, Carlson argues that appropriate aesthetic appreciation of nature does require knowledge, especially that of science and natural history. Carlson is in philosophy at the University of Alberta. (v7,#2)

Carlson, Allen, "On aesthetically appreciating human environments," Philosophy and Geography 4 (No. 1, 2001): 9-24. In this essay I attempt to move the aesthetics of human environments away from what I call the designer landscape approach. This approach to appreciating human environments involves a cluster of ideas and assumptions such as: that human environments are usefully construed as being in general "deliberately designed" and worthy of aesthetic consideration only in so far as they are so designed, that human environments are in this way importantly similar to works of art, and that the aesthetics of human environments thus has much in common with the aesthetics of art. As an alternative to the designer landscape approach, I suggest that the aesthetics of human environments should be understood as a major area of the aesthetics of everyday life. To facilitate this shift I develop the idea of an ecological approach to the aesthetics of human environments and the related notion of functional fit. The ecological approach employs an analogy with natural ecosystems and, by stressing the role of functional fit in each, facilitates the appreciation of both natural and human environments in a way that I characterize as "looking as they should." The upshot, I maintain, is a set of appreciative consequences constituting a more satisfying aesthetic experience of our everyday human environments. Carlson is Professor of Philosophy at the University of Alberta. (P&G)

Carlson, Allen. "Nature and Positive Aesthetics." Environmental Ethics 6(1984):5-34. Positive aesthetics holds that the natural environment, insofar as it is unaffected by humans, has only positive aesthetic qualities and value--that virgin nature is essentially beautiful. In spite of the initial implausibility of this position, it is nonetheless suggested by many individuals who have given serious thought to the natural environment and to environmental philosophy. Certain attempts to defend the position involve claiming either that it is not implausible because our appreciation of nature is not genuinely aesthetic, or that the position is justified in virtue of human limited control and understanding of the natural world or in virtue of the natural world's divine design and origin. Such attempts are inadequate; they neither justify the position nor explain its acceptance. In order to account for positive aesthetics, we must note the intimate connection between nature appreciation and the development of natural science. An understanding of the role of scientific knowledge in the aesthetic appreciation of nature not only sheds light on the acceptance of the positive aesthetics position, but also suggests a means by which to justify it. Carlson is at the philosophy department, University of Alberta, Edmonton, Alberta, Canada. (EE)

Carmin, JoAnn & Balsler, Deborah B., "Selecting Repertoires of Action in Environmental Movement Organizations: An Interpretive Approach". Organization and Environment, 15, (No. 4, 2002): 365-88. Environmental Movement Organizations (EMOs) with similar goals frequently deploy different tactics and strategies to advance their agendas. This article uses an interpretive perspective to examine the factors influencing EMO selection of a repertoire of action. Building on concepts from organization and social movement theories, and relying on interview and archival data from Friends of the Earth and Greenpeace, this study suggests that experience, core values and beliefs, environmental philosophy and political ideology work together to create distinct organizational interpretations of the political environment, efficacy of action, acceptability of tactics, significance of an issue, and source of the problem. These interpretations combine to shape EMO determinations of what types of action will be most appropriate and effective. Although structural factors influence the decisions that are made within EMOs, organizations also rely on interpretive processes in their selection of a repertoire of action. Carmin is an assistant professor in the Department of Urban Affairs and Planning at Virginia Tech. Balsler holds an assistant professor post with a joint appointment in the College of Business Administration and the Public Policy Administration programs at the University of Missouri-St. Louis.

Carnegie Commission on Science, Technology, and Government, The, in the report of a recent task force, has urged creation of a strong top-level institutional mechanism in the Executive Branch of the U. S. Government to provide environmental policy analysis and direction to the President. The report is entitled E3: Organizing for Environment, Energy, and the Economy in the Executive Branch of the U. Carolan, Micael S. "Disciplining Nature: The Homogenising and Constraining Forces of Anti-Markets on the Food System," Environmental Values 14(2005): 363-387. To understand the changing patterns within agriculture, it is important to look not only at social relations and organisational configurations. Also salient to such an analysis is an examination of how those formations give shape to non-humans. Much attention has been placed recently on the political economy of agriculture when speaking of these emergent patterns. Yet in doing this, the natural environment is all too often relegated to the backdrop; where the agro-economy is viewed as something that manoeuvres within the environment but never through it. The conceptual groundwork for this paper draws from two often unconnected scholars: Michel Foucault and Fernand Braudel. In Foucault, we find a framework, with a little conceptual development, through which to talk about how the economy (of both discipline and capital) enters into nature. Specifically, the argument is made that through the embodiment of discipline, nature too becomes

disciplined. Yet in Foucault we find a discursive conception of socio-economic history; where capitalism is discussed, but always as an effect of the discursive structures of power/knowledge. Enter the work of Braudel, to provide us with a materialist counterweight to Foucault's theorising. In Braudel, we find a detailed analysis on the emergence of capitalism, out of which then comes his distinction between markets and anti-markets. In short, when both accounts of history are overlaid, interesting connections between the emergence of Braudelian anti-markets and Foucaultian discipline are revealed. Two brief case studies are then examined to add further depth to the discussion: the first focusing on corn; the second centring on the cow. The paper then concludes speaking on the issue of resistance. Carolan is in sociology, Colorado State University, Fort Collins, CO. (EV)

Carolan, Michael S., "Ontological Politics: Mapping a Complex Environmental Problem," Environmental Values 13(2004):497-522. What is an environmental problem? Philosophers of science and sociologists of knowledge have been writing for more than a decade about the de-centred, multiple object. Yet what if this insight were applied to the realm of environmental problems? What would be revealed? These questions are explored in this paper by examining the ontology of environmental problems. Ethnomethodologists, social constructionists, and sociologists of knowledge have all painted a descriptive picture of a thoroughly sociological ontology; an ontology that is fluid, at times de-centred, and (at least potentially) multiple. Yet if ontology is social, and thus multiple, than it is also ultimately political. But multiplicity need not imply fragmentation. It can be coherent, but this requires both coordination and trust. To give further visual and conceptual shape to this argument a heuristic model is constructed. Through this model I 'map' a handful of environmental problems - in terms of their 'complexity' and 'epistemological distance' - and in doing so give focus to the ontologically diverse nature of environmental problems today. A case study involving a particularly contentious environmental dispute is then examined so as to give the argument additional focus and an empirical grounding. Carolan is in sociology, Colorado State University, Fort Collins, CO. (EV)

Carolan, Michael S., "Risk, Trust and 'The Beyond' of the Environment: A Brief Look at the Recent Case of Mad Cow Disease in the United States," Environmental Values 15(2006): 233-252. The epistemologically distant nature of many of today's environmental risks greatly problematises conventional risk analyses that emphasise objectivity, materiality, factual specificity and certainty. Such analyses fail to problematise issues of ontology and epistemology, assuming a reality that is readily 'readable' and a corresponding knowledge of that reality that is asocial, objective and certain. Under the weight of modern, invisible, manufactured environmental risks, however, these assumptions begin to crack, revealing their tenuous nature. As this paper argues, statements of risk are ultimately social products that come to us by way of translation. They are statements not of what is (ontology) but of knowledge (epistemology) expressed in probabilistic terms, and are thus thoroughly social in nature, for it is we - through our actions and social networks - that imbue them with meaning. One way we do this is through our social relations of trust. And it is this relationship - between trust and risk - that this paper seeks to detail both conceptually and empirically (while remaining grounded in a realist philosophy of science). While one could look toward any number of case studies to develop the conceptual details of this project, this paper focuses on the relatively recent (and first) case of mad cow disease to have been reported within the United States. Here, we have an epistemologically distant, and thus hotly contested, 'object' (or is it?), which has been the source of much risk debate; a debate that is also, in part, the effect of a deeper erosion of trust, particularly toward those managing our meat supply. (EV)

Carolan, Michael S., and Bell, Michael M., "In Truth We Trust: Discourse, Phenomenology, and the Social Relations of Knowledge in an Environmental Dispute" Environmental Values 12(2003): 225-245. In this age of debate it is not news that what constitutes 'truth' is often at issue in environmental debates. But what is often missed is an insight that the speakers of Middle English understood a millennium ago: that truth comes from trust, which, is the central theoretical position of this paper. Our point is that truth depends essentially on social relations - relations that involve power and knowledge, to be sure, but also identity. Thus, challenges to what constitutes the 'truth' are equally challenges to identities and the social

networks of trust in which that truth is embedded. We therefore attempt to move beyond Foucaultian discursive theory by reintroducing the subject as both the product and producer of discourse.

For Foucault, the subject is reduced to the discursive relations of power/knowledge. In his effort to free us from the Cartesian cogito and the modernist absolutisms that eventually followed, Foucault lapses into a kind of postmodern functionalism. We argue that we should not speak of power/knowledge, as Foucault suggested, but of power/knowledge/identity, recovering the actors and concrete social relations that produce discourse, and are not only produced by it. We then argue that these social relations become constituted (and reconstituted) in particular moments of phenomenological challenge - discursive moments that confront the existing social relations of knowledge and their dialogue of trust and truth. We illustrate the implications of a threat to the social relations of environmental knowledge through an analysis of one such moment of phenomenological challenge: a dispute over whether or not the power plant in the community where we used to live, Ames, Iowa, is producing dioxin.

Carolan, Michael S., "Conserving Nature, But to What End? Conservation Policies and the Unanticipated Ecologies They Support," Organization and Environment, 19 (no. 2, June 2006): 153-170. The author examines various cases of conservation policies in practice, and the implications of those practices in terms of the ecologies they support, showing, in the end, that the "nature" being preserved is not always the one intended. In doing this, insights are also gleaned to inform the future of environmental sociology. Carolan is in sociology at Colorado State University.

Carolan, Michael S., "The Multidimensionality of Environmental Problems: The GMO Controversy and the Limits of Scientific Materialism," This paper argues for a broader understanding of complexity; an understanding that speaks to the multidimensionality of environmental problems. As argued, environmental problems rest upon ontological, epistemological, and moral claims; they rest, in other words, upon statements about what is, knowledge, and what ought to be, respectively. To develop and illustrate this argument, the GMO (genetically modified organism) controversy is broken down according to these three dimensions. Dissecting environmental problems in this manner reveals why we cannot look solely toward the natural sciences for resolution: because these problems beg questions that cannot be answered with references to materiality alone.

Carone, Gabriela Roxana. "Plato and the Environment." Environmental Ethics 20(1998):115-33. I set out to refute several charges that have recently been raised against Plato's attitude toward the environment and to present him under a new light of relevance for the contemporary environmental debate. For this purpose, I assess the meaning of Plato's metaphysical dualism, his notion of nature and teleology, and the kind of value that he attributes to animals, plants, and the land in general. I thus show how Plato's organicist view of the universe endows it with an intrinsic value that is over and above each of its parts, including humans, and provides an argument for the preservation of species of nonhuman animals, which in many relevant ways are not ranked below the human species. In addition, I show how Plato's dialogues provide good evidence for human concern about the environment and how such a concern is promoted

rather than hindered by his nonanthropocentric notion of teleology. Carone is in the Department of Philosophy, University of Colorado, Boulder. (EE)

Carpenter, Betsy, "A Panther by Another Name: Should the Government Protect Imperiled Animals That Fool Around Outside the Species?" U. S. News and World Report, June 17, 1991. How pure does an animal have to be before it merits protection? Illustrated by the Florida panther problem and the wolf-coyote interbreeding. The panther carries some genes of a South American cousin. Wolves and coyotes rarely interbreed "Merely possessing a smidgen of coyote blood does not automatically transform a wolf into a woyote (half-breed hybrid)." "The biological significance of the crossmating is nearly nil," quoting Timm Kaminski, U.S. Forest Service wolf expert. Given the high rates of extinction among some species, "There will be more and more times when hybridization will be the only way to hold on to a least a chunk of a species's rich library of genes." "When a hybrid is all we've got, we should go for it," quoting geneticist Stephen O'Brien. (v2,#2)

Carpenter, Betsy and Bob Holmes, "Living with Nature," U. S. News and World Report, November 30, 1992. Story on Edward O. Wilson's urgent defense of biodiversity. Wilson says, "Wilderness settles peace on the soul because it needs no help; it is beyond human contrivance. Wilderness is a metaphor of unlimited opportunity, rising from the tribal memory of a time when humanity spread across the world ... godstruck, firm in the belief that virgin land went on forever." With the loss of wild nature, "we face an enormous psychological and spiritual loss." We "court spiritual disaster." (v3,#4)

Carpenter, Stephen R. et al (six others), "Millennium Ecosystem Assessment: Research Needs," Science 314(13 October 2006):257-258. "We lack a robust theoretical basis for linking ecological diversity to ecosystem dynamics and, in turn, to ecosystem services underlying human well-being. ... The most catastrophic changes in ecosystem services identified in the MA (Millennium Assessment) involved nonlinear or abrupt shifts. We lack the ability to predict thresholds for such changes, whether or not such a change may be reversible, and how individuals and societies will respond. ... Relations between ecosystem services and human well-being are poorly understood. One gap relates to the consequences of changes in ecosystem services for poverty reduction. The poor are most dependent on ecosystem services and vulnerable to their degradation. Empirical studies are needed."

Carpenter, Stephen R. Sallie W. Chisholm, Charles J. Krebs, David W. Schindler, and Richard F. Wright. "Ecosystem Experiments." Science 269(1995):324-327. Experimental manipulations of ecosystems have produced some surprising results. (v6,#3)

Carr, Anna; Wilkinson, Roger, "Beyond Participation: Boundary Organizations as a New Space for Farmers and Scientists to Interact," Society and Natural Resources 18(no.3, March 2005):255-265(11).

Carr, Ethan, Wilderness by Design: Landscape Architecture and the National Park Service. Lincoln, NE: University of Nebraska Press, 1998. 378 pages. \$ 45 cloth. Even though the public still equates the national parks with primordial, untouched wilderness, Carr claims that the reality is considerably different. Not only is the conception of a park a cultural construct, but the very appearance and design of national parks is based on social conventions, for example, aesthetic and political ideologies, that allow "land" to become "landscape." "The designed landscapes in national and state parks, as works of art, directly express the value society invests in preserving and appreciating natural areas. Few other arts, with the exception of landscape painting, more fully explore this leitmotif of American culture. Neither pure wilderness nor mere artifact, the national park is the purest manifestation of the peculiar American genius which sought to reconcile a people obsessed with progress with the unmatched price paid for that advance: the near total loss of the North American wilderness" (p. 9). Carr, Susan, "Ethical and Value-Based Aspects of the European Commission's Precautionary Principle," Journal of Agricultural and Environmental Ethics 15(no. 1, 2002):31-38. In February 2000, the European Commission adopted a Communication on the precautionary principle. This states how the Commission intends to apply the principle and establishes guidelines for its application. The document is intended to inform discussions on international agreements. In particular, it provides a defense of European Union (EU) precautionary policies in case of trade disputes, for example, in case the EU is accused of imposing unfair trade barriers on exports of genetically-modified (GM) products from the United States under the rules of the World Trade Organisation. In the communication, the Commission emphasizes the scientific aspects of the precautionary principle, perhaps partly to counter claims from US officials that the EU's reluctance to accept GM imports is not based on science but is politically motivated. However, a principle is by definition a moral guide to behavior. In other words, it is an ethic. The precautionary principle should be viewed as a complement to science, to be invoked when a lack of scientific evidence means that outcomes are uncertain. Any interpretation of this principle needs to place at least as much emphasis on its ethical and value-based aspects as on its scientific justification. The Commission's interpretation risks undermining the painstaking progress made among European Union member states in responding to public concern about GM crops and food by adopting increased precaution. This paper explores the balance between the scientific and ethical/value-based aspects of the precautionary principle as set out in the Commission's communication, to make the case that it is the ethical and value-based aspects rather than the scientific aspects of the guidelines that need strengthening. KEY WORDS: ethics, GM crops, precautionary principle, trans-Atlantic trade. Carr is with the Biotechnology Policy Group Centre for Technology Strategy, The Open University, Milton Keynes, UK. (JAEE)

Carraro, C., ed. International Environmental Negotiations: Strategic Policy Issues. Cheltenham: Edward Elgar, 1997. Review by Kjell Sunevag, Environmental Values 10(2001):130. (EV)

Carrere, Ricardo and Larry Lohmann. Pulping the South: Third World Tree Plantations in the Global Paper Economy. Atlantic Highlands, NJ: Humanities Press, Zed Books, 1996. In many regions of the South today, the expansion of the pulp and paper industry is one of the most important causes of land and water conflicts. Information from a wide range of countries and sources on the threats to livelihood, soil, and biodiversity generated by large-scale pulpwood plantations. Case studies from Brazil, Chile, Indonesia, South Africa, Thailand and Uruguay. How a varied assemblage of actors both inside and outside the state construct the social and physical grids through which the wood-fiber industry captures subsidies, redistributes risk, manages paper demand and evades, digests, and regulates resistance. (v7,#1)

Carrere, Ricardo. "Pulping the South: Brazil's Pulp and Paper Plantations", The Ecologist 26(no.5, 1996):206. Demand for paper is soaring, particularly in the North. To supply cheap pulp, fast-growing tree plantations are being established on the forests, pastures and farmlands of the South, with severe environmental and social impacts. Anticipating opposition to their activities, the pulp and paper industry has become adept at "greenwashing" its activities. A case study of three of Brazil's leading pulp operations compares the companies' claims with their impacts on the ground. (v7,#4)

Carrick, Paul, "Environmental Ethics and Medical Ethics: Some Implications for End-of-Life Care,"

Cambridge Quarterly of Healthcare Ethics 8(no. 2, 1999):250-256.

Carrier, Jim. "Unbearable Futures: Behind the Cuteness Lies an Ethical Debate." The Denver (Colorado) Post, 3 April 1995, 1A, 12A. The Denver Zoo has two polar bear cubs, Klondike and Snow, stars in a zoo of ooohs, in an exhibit with lines waiting to see them a quarter of a mile long, and March was the biggest month in zoo history. Polar bear doll sales were \$7,000; the bears even have their own touch-tone button on the Denver Zoo switchboard. But University of Colorado philosopher, Dale Jamieson, says the bears are condemned to a life of captivity, and there is a "moral presumption against keeping wild animals in captivity." University of Colorado zoologist, Mark Bekoff says that "a polar bear in captivity is not a polar bear," since the public sees them, unrealistically, as cute and cuddly creatures, and that "it's extremely self-centered [of humans] to have cute little polar bears in captivity." William Conway, director of the New York Zoo, replies that the most serious threat to wild creatures" is that they will be ignored ... the most profound and moving lessons zoo education has to offer are simply well cared-for, well-exhibited, living animals."

Carrier, Paul, "The Hidden Costs of Environmentally Responsible Health Care," Perspectives in Biology and Medicine 48(no. 3, 2005):4530463. Review essay of Pierce, Jessica and Andrew Jameton, The Ethics of Environmentally Responsible Health Care (Oxford: Oxford University Press, 2004). Pierce and Jameton worry about the environmental (and other) costs of high tech medicine and medical care and advocate the model of a "Green Health Center." Carrick appreciates this, but worries that sick patients may be pressured to think more about preserving the health and welfare of the surrounding environment than preserving their own health. Perhaps only those therapies and treatment goals that tend to reduce negative impacts on the environment would be considered morally acceptable. Carrick thinks this is "a deadly gamble," which might result in the loss of patient autonomy, in ecological paternalism, and cheapen the respect for life, giving priority to the ecosystem over individual life. With a response by Pierce and Jameton. Carrick is in philosophy, Gettysburg College, Gettysburg, PA.

Carroll, C, et al., "Defining Recovery Goals and Strategies for Endangered Species: The Wolf as a Case Study," BioScience 56 (no. 1, January 2006): 25-37. We used a spatially explicit population model of wolves (*Canis lupus*) to propose a framework for defining rangewide recovery priorities and finer scale strategies for regional reintroductions. The model predicts that Yellowstone and central Idaho, where wolves have recently been successfully reintroduced, hold the most secure core areas for wolves in the western United States, implying that future reintroductions will face greater challenges. However, these currently occupied sites, along with dispersal or reintroduction to several unoccupied but suitable core areas, could facilitate recovery of wolves to 49% of the area in the western United States that holds sufficient prey to support wolves. That percentage of the range with recovery potential could drop to 23% over the next few decades owing to landscape change, or increase to 61% owing to habitat restoration efforts such as the removal of some roads on public lands.

Carruthers, P., The Animals Issues. New York: Cambridge University Press, 1992. Enlarges the argument of "Brute Experience." Animals, even if they do feel pain, are not rational agents, and outside the social contract of morality. But animals, although they have pain mechanisms and unconscious mental states, are incapable of feeling pain and are therefore morally irrelevant. Carruthers is in philosophy at the University of Essex.

Carruthers, Peter, "Brute Experience," Journal of Philosophy 86 (1989):258-269. "The question whether brutes have experience has been granted as obvious in recent times, and in one sense of the term 'experience' no doubt it is so. But not, I shall argue, in the sense that makes their experience an appropriate object of moral concern." "Many experiences ... do not feel like anything." These are "nonconscious experiences." Only conscious experiences have a distinctive phenomenology, a distinctive feel." Based on "the nonconscious status of most animal experiences," Carruthers concludes that "in the case of brutes: since their experiences, including their pains, are nonconscious ones, they are of no immediate moral concern." "Much time and money is presently spent on alleviating the pains of brutes which ought properly to be directed toward human beings. ... Such activities are not only morally unsupportable but morally objectionable." "And it also follows that there is no moral criticism to be leveled at the majority of people who are indifferent to the pains of factory-farmed animals." Carruthers is in philosophy at the University of Essex. (v3,#4)

Carter, Alan, Review of: Andrew Dobson, Justice and the Environment, Environmental Values 11(2002):120-123.

Carter, Alan, "Some Theoretical Foundations for Radical Green Politics," Environmental Values 13(2004):305-328. On the basis of our apparent obligations to future generations, it would seem that we are morally obliged to reduce the risk our environmentally destructive behaviour poses for their well-being. But if, rather than choosing to destroy the environment, we are in fact driven to do so, then any obligation to reduce our environmental impact requires an understanding of the mechanism driving our behaviour. This article argues that the State-Primacy Theory provides a plausible explanation for the nature of that mechanism, and concludes that the most common strategies offered as a response to our environmental impact are most likely to be insufficiently radical to meet our seeming obligations effectively. Carter is in philosophy, University of Colorado, Boulder. (EV)

Carter, Alan. "Humean Nature." Environmental Values 9(2000):3-37. Abstract: It has been argued that there is an irreconcilable difference between those advocating animal liberation or animal rights, on the one hand, and those preferring a wider environmental ethic, which includes concern for non-sentient life-forms and species preservation, on the other. In contrast, I argue that it is possible to provide foundations for both seemingly environmentalist positions by exploring some of the potential of a 'collective-projectivist' reading of Hume - one that seems more consistent with Hume's texts than other readings. In short, this article seeks to advance our understanding of some of the possibilities within Humean moral theory, while simultaneously providing new foundations for both animal welfare and a wider environmental ethic. Carter, Alan. "Can We Harm Future People?" Environmental Values 10(2001):429-454. It appears to have been established that it is not possible for us to harm distant future generations by failing to adopt long-range welfare policies which would conserve resources or limit pollution. By exploring a number of possible worlds, the present article shows, first, that the argument appears to be at least as telling against Aristotelian, rights-based and Rawlsian approaches as it seems to be against utilitarianism, but second, and most importantly, that it only holds if we fail to view moral agents as individuals. The article also concludes that the argument has profoundly counter-intuitive implications. Keywords: Future generations, Schwartz, Parfit, non-identity problem, person-affecting principle. Alan Carter is in the Department of Philosophy, University of Colorado at Boulder, CO, USA. (EV)

Carter, Alan. "Saving Nature and Feeding People." Environmental Ethics 26(2004):339-360. Holmes Rolston, III has argued that there are times when we should save nature rather than feed people. In arguing thus, Rolston appears tacitly to share a number of assumptions with Garrett Hardin regarding the causes of human overpopulation. Those assumptions are most likely erroneous. Rather than our facing the choice between saving nature or feeding people, we will not save nature unless we feed people.. (EE)

Castelo, Carmen Velayos, "Reflections on Stoic Logocentrism," Environmental Ethics 18(1996):291-296. William O. Stephens is to be applauded for the way in which he presents and analyzes some paradigmatic Stoic arguments, and thus defends Stoicism from the misplaced charges of Jim Cheney. Nonetheless, Stephens's individualist interpretation of what he calls Stoic 'logocentrism' obscures key features of the Stoics' theory of value and their related ethic and metaphysic. Once the Stoics are allowed to speak for themselves, it emerges that they adhered to a holistic axiology, that for them virtue lay in conformity with cosmic nature, and that the standard charges of anthropocentrism and blindness to natural beauty, often wielded by environmental philosophers against them, are misguided. Castelo is in philosophy, University of Salamanca Campus Unamuno, Salamanca, Spain. (EE)

Castle, David. "Limitations on an Inclusive Definition of Ecosystem-Human Health." Ethics and the Environment 5(2000):153-162. ABSTRACT: The ecology movement has been effective in focusing our attention on humanity's antipathy toward nature and the risks associated with that antipathy. Evidence of the effects of human-caused environmental destruction performed in the march of progress has long been recognized, but it has been realized only recently that degraded environments can reciprocate and impose severe if not final limits on human pursuits. Ecologists and philosophers who have foreseen our environmental midnight have attempted to reformulate contemporary society so that humanity and nature can work in concert, not in opposition. In this respect, the ecological movement has sponsored various forms of ecocentrism, all of which are distinguished by their attempt to integrate the norms underlying ecosystem health and human health. Despite the fact that significant aspects of the ecocentrist platform have been called into question (Steverson 1994), the prospect of their integration still has appeal. An integrated definition would imply that concern for human and natural welfare could be coextensive and that right action would simultaneously benefit humans and nature. Ostensibly, an inclusive definition of ecosystem-human health must satisfy two basic criteria. It must 1. Articulate the relationship between

human health and ecosystem health, 2. Provide a set of norms that are consistent for human health and ecosystem health. I argue that an analysis of the basic principles underlying ecosystem health and human health enable us to answer (1), but that it is not presently possible to answer (2). (E&E)

Castle, Emery N., "A Pluralistic, Pragmatic and Evolutionary Approach to Natural Resource Management," Forest Ecology and Management 56(1993):279-295. Four requirements must be satisfied by natural resource management. (1) It must provide for economic and social change, especially true in modern societies. (2) It must recognize the interdependence of humans and the natural environment. (3) The welfare of future generations must be considered. (4) The process by which group decisions are made is critical. Castle reaches three conclusions: (1) No single environmental ethic or philosophical system exists nor is one likely to be discovered that will guide environmental policy, though several philosophical approaches help. Natural resource policy is necessarily pluralistic. (2) Pluralism is not an acceptable comprehensive system because it does not forbid inconsistencies. For this reason policy must be pragmatic, and democracy is a pragmatic device. (3) Social and natural systems co-exist through time and must mutually adapt, though neither is stable or predictable far into the future. Castle teaches economics at Oregon State University. Castree, Noel. *Nature*. London: Routledge, 2005. This is offered as "an incisive introduction to the nature that geographers study." "The nature that geographers produce must, therefore, be seen as part of a high-stakes contest over how we understand and act towards those myriad things we label 'natural.' This contest has implications for us all, as well as for the non-human world" (frontis). A quite problematic part of the contest, it turns out, is that geography is itself a "schizophrenic field" (p. 179), torn between the physical geographers who think that nature is real and the cultural geographers who are oversold on the social construction of nature. Castree is in the School of Environment and Development at Manchester University (UK).

Catton, Jr., William R., "Kulturelle Rueckstaendigkeit gefaehrdet die Zukunft der Menschheit" (article in German) *Humanity's Future Imperiled by Cultural Lags*. Natur und Kultur, Vol. 1/2, 2000, pp. 3-25. Abstract: Human societies exploiting Earth's ecosystems beyond carrying capacity make ideas about human dominion obsolete. Formerly successful policies become disastrous. With six billion humans using Earth three ways (as supply depot, activity space, and disposal site) mutual interference between these uses escalates. Technological advances, once progressive, now enlarge per capita resource appetites and impacts, reducing the number of humans the planet can continue supporting. Sustainability requires enormous efficiencies and a period of "negative population growth". (v.11,#4)

Issues of population dynamics, risk assessment, and wildlife management, balanced against social and cultural pressures such as economics and legislation. (v8,#1)

Caughley, Graheme. "Directions in Conservation Biology." Journal of Animal Ecology 63(1994):215-244. Most theories about conservation have been developed in studies of species that occur in small populations under constrained conditions. These are amenable to theoretical treatment, but the theory provides an answer to a trivial question, How long will the population persist if nothing happens. It bears tenuous relevance to the specific problems of aiding a species in trouble. The real conservation problems, however, involve species that are declining in numbers from widespread, large populations. The reasons are humdrum, various, defy tight generalization, and not of theoretical interest. But such theory is in urgently needed to orient practice. Caughley is with the CSIRO Division of Wildlife and Ecology, Canberra, Australia. (v6,#3)

Causey, Ann S. "On the Morality of Hunting." Environmental Ethics 11(1989):327-343. The controversy between hunting apologists and their anti-hunting antagonists continues to escalate. Numerous attempts to settle the issue have failed in part because the participants have often not distinguished and treated separately the various activities labeled "hunting." Those who participate in hunting fall into one of two categories: shooters or sport hunters. Shooters are those whose ultimate goals do not depend on hunting but can be met in other ways; sport hunters are those who take immense pleasure in the hunt itself and who kill in order to have had an authentic hunting experience. Discussion of the morality of hunting (as opposed to its prudence) is properly restricted to the moral evaluation of the desire of sport hunters to kill for pleasure. This desire can be explained by biological/evolutionary concepts and defended as morally neutral. Neither the animal protectionists nor the utilitarian apologists recognize that violent death is part of nature and that man's desire to participate in it can be both natural and culturally valuable. Though well-intentioned, utilitarianism is an impotent ethical defense of hunting because it can judge only the prudence, not the morality, of hunting. Causey is in the department of Botany and Microbiology, Auburn University, Auburn, AL. (EE)

Cavalieri, Paola, and Singer, Peter, eds., The Great Ape Project: Equality Beyond Humanity. London: Fourth Estate, 1993.

Cavalieri, Paola, Why Non-Human Animals Deserve Human Rights. New York: Oxford University Press, 2001. It is necessary to go beyond the traditional opposition between utilitarianism and Kantianism and focus on the question of fundamental moral protection. In the case of human beings, such protection is granted within the doctrine of universal human rights. The logic of this doctrine extends to non-human animals who are owed basic moral and legal rights. As a result, human rights are not merely human, after all. Cavalieri is editor of the journal Ethics and Animals. (v.13,#1)

Cavanaugh, Michael, "Global Population Equilibrium: A Model for the Twenty-First Century," Zygon 32(1997):163-174. A global population in equilibrium can serve as an organizing model, or scientific myth, both as a plausible description of reality and a goal with a compelling normative status. Few deny that, unless humans stabilize their population, our world will face serious problems before the year 2050, and a consensus about this can unite persons in many cultures, and also join scientific and theological perspectives. (v8,#2)

Cave, George S. "Animals, Heidegger, and the Right to Life." Environmental Ethics 4(1982):249-54. Quantitative utilitarianism demands equal treatment of human and nonhuman animals where there are no relevant differences between them. A difference is relevant only if it excludes the animal from suffering evil if it is treated differently. Quantitative utilitarianism cannot, however, resolve conflicts of interest nor prove that painless killing of animals is morally wrong. For this we need a higher qualitative good. I suggest that Care, as Heidegger understands it, is such a good, and that it is the essence not only of human, but of nonhuman animal Dasein as well. Because animals care, we are morally obliged to desist from killing them, even painlessly. Cave is an animal rights activist at State College, PA. (EE)

Cenci Goga, Beniamino T., and Clementi, Francesca, "Safety Assurance of Foods: Risk Management Depends on Good Science but it is not a Scientific Activity," Journal of Agricultural and Environmental

Ethics 15(no. 3, 2002):305-313. We make many decisions in our lives and we weigh the benefits against the drawbacks. Our decisions are based on what benefits are most important to us and what drawbacks we are willing to accept. Decisions about what we eat are made in the same way; but when it comes to safety, our decisions are usually made more carefully. Food contains natural chemicals and it can come into contact with many natural and artificial substances during harvest, production, processing, and preparation. They include microorganisms, chemicals, either naturally present or produced by cooking, environmental contaminants, and pesticides. Since the chance of being harmed by these potential hazards is called risk, risk analysis might be better termed as the science of safety, because risk management is an essential part of it. It would, however, be difficult and shortsighted to maintain that questions about risk and safety can have no moral dimension. Risk and safety become matters of moral concern when they raise further questions about responsibility, accountability, and justifiability. The question of risk cannot be ignored in any ethical investigation of genetic engineering, novel foods, animal welfare, and individual choices. However, food is more than metabolic fuel. It has physiological, psychological, social, cultural, and aesthetic associations that merge to form a gestalt that people endanger and maintain. The contribution of any food towards an individual's well being is as complex as the individual himself. In this context, the benefits of consuming food that contains hazards may outweigh the risk. KEY WORDS: food safety, food science, risk management. Cenci Goga is in the Dipartimento di Scienze degli Alimenti, Universita degli Studi di Perugia, Perugia, Italy. To date impacts have been relatively benign, but the prospect of continued growth brings some concerns about the adequacy of existing rules and calls for continued surveillance and research. Cessford is with the Department of Conservation in Wellington, New Zealand. (v.8,#4)

CGIAR: Agricultural Research for Whom?" The Ecologist 26 (no.6, 1996): 259. Off-farm agricultural research plays a central role in shaping the current and future direction of agriculture. Who controls that research and who sets its agenda is of critical importance for food security. Of particular concern is the influence exerted by the Consultative Group on International Agricultural Research (CGIAR). Under its direction, research has been geared towards intensive, industrialized method of production--at great cost to genetic diversity, the environment and poorer farmers in the South. Non-governmental organizations are pressing CGIAR to implement wide-ranging changes so as to restructure its research agenda and decision-making processes. (v8,#2)

Chahal, Surjeet Kaur, Environment and the Moral Life: Towards a New Paradigm. New Delhi: Ashish Publishing House, 1994. ISBN 81-7024-615-6. The first systematic work on environmental ethics from a philosopher in India. Chapter titles: Necessity and Possibility of Environmental Ethics. The Problem of Interests and Rights in Environmental Ethics. Reflective Equilibrium--A Framework for Environmental Ethics. Environmental Ethics: The Ultimate Questions. She develops a holistic approach towards the geosphere, on the basis of which she hopes for a change in the prevalent behavior towards nature and preserving the environment for future generations. "The problems of environmental ethics restore a sense of urgency and realism to the philosophical enterprise itself" (p. vii). She is well read in the British and American literature, and draws especially from the Sikh tradition. The author teaches philosophy at the University of Poona (or Pune), inland from Bombay (or Mumbai). (v9,#1)

Chahal, Surjeet Chahal, Ecology Redesigning Genes: Ethical and Sikh Perspective. Amritsar, India: Singh Brothers, 2005. Research in genetics cannot be isolated from its impact on ecology. With the genes redesigned, with newer organisms appearing and various unwanted species eliminated, it may not be possible for us to undo the damage to the biosphere. Genetic technology challenges the relationship between God, humans, and the rest of nature. A Sikh perspective. Chahal is in philosophy, University of Pune, India.

Chaloupka, William J., "Tragedy of the Ethical Commons: Demoralizing Environmentalism." Pages 113-140 in Jane Bennett and Michael J. Shapiro, eds., The Politics of Moralizing. New York: Routledge, 2002. Chaloupka is in political science, Colorado State University.

Chaloupka, William. "John Dewey's Social Aesthetics as a Precedent for Environmental Thought." Environmental Ethics 9(1987):243-60. In this essay I review John Dewey's pragmatism from the perspective of environmental social theory. Dewey's clarification of aesthetics, values, experience, and the natural world are useful to contemporary environmentalism. His work represents a precedent for critical, anti-dualistic social philosophy in the U.S., and usefully clarifies the relationship of humans to the "material world." Dewey's conception of values, politics, and experience suggests that these elements

may be combined in ways congenial to environmental thought. Chaloupka is at the Political Science Dept., University of Montana, Missoula, MT. (EE)

Chapman, Anne, "The Ways That Nature Matters: The World and the Earth in the Thought of Hannah Arendt," *Environmental Values* 16(2007): 433-445. One of the many sets of distinctions made by Hannah Arendt was that between the world and the earth. I give two different interpretations of this distinction then set out four different ways in which nature matters to us, depending on whether nature is regarded as world or as earth, and whether humans are seen as biological beings or as beings who create and inhabit a world. These different ways are represented in different forms of environmentalism and theories of environmental ethics. The controversy over wind farms in the UK as an instance in which two of the different ways that nature matters come into conflict with each other. Chapman lives in Lancaster,

UK.

Chapman, Audrey R., Unprecedented Choices: Religious Ethics at the Frontiers of Genetic Science. Minneapolis: Fortress Press, 1999. We now face, from genetic science, urgent and unprecedented choices that may involve re-designing our nature, for which traditional ethics provides little direct guidance, and science provides even less. How can we integrate religious, ethical, and scientific reasoning in this crisis?

Jewish, Roman Catholic, Protestant perspectives. (v.14, #4)

Chapman, Audrey R., "The Greening of Science, Theology, and Ethics." Pages 211-227 in Peters, Ted., ed., Science and Theology: The New Consonance (Boulder, CO: Westview Press, 1998). "The constructive thesis of this article is that a greater integration of science into eco-theology and eco-ethics could contribute significantly to the development of ecological theology (eco-theology) and ecological ethics (eco-ethics). A multi-disciplinary perspective could provide greater conceptual rigor, concreteness, and relevance to these specializations. A scientific grounding is essential if eco-theology and eco-ethics are to understand and come to terms with what is happening to the planet as a basis for formulating an appropriate theological response. Humanity's spiritual life and future depend, not so much on an exhortation to lead a sustainable and develop a sustainable society, but on learning what makes for sustainability and wrestling with the difficult theological, moral, social, and environmental issues it raises" (pp. 212-213). Chapman is program director for the American Association for the Advancement of Science, Dialogue between Science and Religion, Washington, DC. (v.10,#3)

Chapman, Audrey R., Unprecedented Choices: Religious Ethics at the Frontiers of Genetic Science. Minneapolis, MN: Fortress Press, 1999. A thorough survey of what ethicists, especially religious ethicists, have said about genetics: cloning, patenting life, DNA modification for therapeutic purposes or for designer children. One conclusion is that theologians find it difficult to translate the reverence for life in their traditions into applied ethics in the unprecedented challenges posed by possibilities in genetics. A variety of conclusions is often possible. But science without ethical guidance is also irresponsible. Chapman is Director of the Dialogue on Science, Ethics, and Religion, a program of the American Association for the Advancement of Science, Washington.

Chapman, Robert L. "The Goat-stag and the Sphinx: The Place of the Virtues in Environmental Ethics," Environmental Values 11(2002):129-144. Standard virtue ethics approach to environmental issues do not go far enough because they often lack significant attachment to local environments. Place provides the necessary link that enlarges the arena of moral action by joining human well-being to a place-based goal of wildness (Thoreau) or biotic harmony (Leopold). Place defines a niche for human activity as part of nature. Virtuous action, then, is understood as deliberation from a position of being in and of the natural world; respect and gratitude are examples of this type of deliberation. (EV)

Chapman, Robert L., "Ecological Restoration Restored," Environmental Values 15(2006): 463-478. Conceptual and methodological changes in ecology have the potential to alter significantly the way we view the world. A result of embracing a dynamic model ('the flux of nature', and 'disturbance regimes') has been to make ecological restoration projects a viable alternative, whereas under 'equilibrium ecology' (climax communities/nature-knows-best) restoration was considered destructive interference. The logic of sustainability strategies within the context of dynamic forces promises a greater compatibility with anthropogenic activity. Unhappily, environmental restoration turns out to be paradoxical under the current identification of wilderness with wildness where wildness is, at least, a necessary condition for the possession of natural value. The solution to the paradox is to separate wilderness from wildness both conceptually and ontologically by enlarging the domain of wildness to include certain human activities. (EV)

Chapman, Robert L., has completed a Ph.D. dissertation, "Values Beyond Culture: A Study in Environmental Axiology," at Fordham University, Bronx, NY, under Elizabeth Kraus. The central argument is that nature possesses non-instrumental value. The arguments are mainly aesthetic and favorably supplement a purely ethical approach to environmental value. Chapman is now adjunct assistant professor at Pace University, New York, New York, where he is teaching environmental ethics and establishing a degree program in environmental studies. (v3,#4)

Chapman, Robert L. "Immigration and Environment: Settling the Moral Boundaries." Environmental Values 9(2000):189-209. Abstract: Large populations fuelled by immigration have damaging effects on natural environments. Utilitarian approaches to immigration (whether restrictive or permissive) are inadequate, since they fail to draw the appropriate boundaries between people, as are standard rights approaches buttressed by sovereignty concerns because they fail to include critical environmental concerns within their pantheon of rights. A right to a healthy environment is a basic/subsistence right to be enjoyed by everyone, resident and immigrant alike. Current political-economic arrangements reinforced by familiar ethical positions that support property rights and preference satisfaction favours (privileged) residents while directly or indirectly denying basic rights to potential immigrants and should be abandoned and a basic rights procedure adopted. Keywords: Dependency theory, livable environment, subsistence rights, utilitarianism. Chapman is in the Department of Philosophy and Religious Studies, 41 Park Row - Schiff Faculty Center, New York, NY 10038, USA. (EV)

Charlton, Noel G. *Understanding Gregory Bateson: Mind, Beauty, and the Sacred Earth*. Albany: State University of New York Press, 2008. Charlton presents an overview of the science/philosophy of holistic thinker Gregory Bateson (1904-1980) by exploring the evolution of Bateson's ideas and situating Bateson's thought in relation to other ecological thinkers. Bateson developed a theory of mental processes and mind that were immanent in nature. From this, Charlton reconstructs a Batesonian understanding of aesthetics, awe of the sacred, and need to develop a new ecological ethics that reconnects people with the living world.

Chase, Alston, In a Dark Wood: The Fight over Forests and the New Tyranny of Ecology. New York: Ticknor and Fields (Houghton Mifflin), 1995. A pair of contrasting reviews by Terry L. Anderson and Karl Hess, Jr., with Alston Chases rejoinders, is in PERC Reports (502 S. 19th Avenue, Suite 211, Bozeman, MT 59715). Anderson: "The main contribution of this book is that it exposes the lack of any scientific basis for biocentrism and ecosystem management. ... By embracing biocentrism and ecosystem management, environmentalists have `confused science with philosophy, facts with values, and truth with mythology.' .. The emperor has no clothes. I hope that In a Dark Wood will cripple the idea if not drive a stake into the heart and soul of biocentrism." Hess: There is "a demon in Chase, a mean-spiritedness aimed willy-nilly at greens. In a Dark Wood is a compendium of prejudicial pseudo-science, ad hominem attacks, and facile analyses. It is environmental clearcutting at its most sophisticated and also at its worst. ... Chase is shakiest when attacking ecologists for embracing static models of nature. Here he is dead wrong. Chase bogs down in eco-bashing. By innuendo and coincidence (Nazis were green) he tries to link ecology and biocentrism to tyranny."

Each confronts the modern scientific image of an alien nature and each elaborates alternative versions of connections with nature and with their own past. Chawla teaches at Whitney Young College, an interdisciplinary honors college at Kentucky State University. (v5,#3)

Chawla, Saroj. "Linguistic and Philosophical Roots of Our Environmental Crisis." Environmental Ethics 13(1991):253-62. I suggest a close relationship between language, philosophy, and our handling of the natural environment. My focus is on unconscious language habits and the presuppositions about reality or world view which underlie these language habits. I discuss three distinct features of Amerindian languages and the English language. Amerindian languages do not give form to intangibles and mass nouns, they make a distinction between spatial and metaphorical aggregates (real and imaginary nouns), and they treat time as being continuous or fluid. In contrast, the English language does give form to intangibles and mass nouns, uses the same terminology for real and imaginary nouns, and has a fragmented (three-dimensional) perception of time. As a result, English language habits are not very conducive to a holistic and careful attitude toward the natural environment. Chawla is in the department of Sociology, York University, North York, Ontario, Canada. (EE)

Chazdon, Robin L., "Tropical Forests- Log'Em or Leave'Em?" Science 281(28 August 1998):1295-1296. Isolated forest fragments, logged forests, and second-growth forests are now being recognized for their value in the conservation of biodiversity, for example in forests of Borneo. But these results cannot be generalized to all forests, and other forests are unlikely ever to recover their original composition after logging. Chazdon is in ecology and evolutionary biology at the University of Connecticut, Storrs. (v.9,#4)

Chester, Mark, "Wolf Spirit Returns to Idaho," National Wildlife 36 (no. 5, August/September 1998):32-41. The Nez Perce Indians bring a spiritual dimension to restore endangered gray wolves to former habitat. The Indians are in charge of a group of wild wolves transplanted to Idaho by the U.S. federal government. Horace Axtell, spiritual leader of the tribe, says, "I told them they're back on their land and gave them a blessing so they'll multiply and become part of this circle of life again."

Cheetham, Tom. "The Forms of Life: Complexity, History, and Actuality." Environmental Ethics 15(1993):293-11. A fundamental misapprehension of the nature of our being in the world underlies the general inhumanity and incoherence of modern culture. The belief that abstraction as a mode of knowing can be universalized to provide a rational ground for all human knowledge and action is a pernicious and unacknowledged background to several modern diseases. Illustrative of these maladies is the seeming dichotomy between the aesthetic and the analytic approaches to nature. One critical arena in which the incoherences of our current understandings of our place in nature come to light is in the battle over the environment. I argue that a more adequate conceptualization of our place in the natural world can be erected if the central metaphors for our understanding are grounded in notions derived from the sciences of life. The key concepts must include contingency, historicity, evolution, organism, and imaginative interaction with concrete reality in individual human beings. Cheetham is in the Program in Environmental Studies, Department of Biology, Wilson College, Chambersburg, PA. (EE)

Chen, Nancy Tzu-Mei, Introduction to TESA Series in Thought and Praxis of Environmental Ethics: Volume II: *From Land Ethics to Earth Charter*

Introductions to Volume II by Dr. Tsao-Cheng Lin (National Cheng Kung University) and Dr. Sun-Mei Wang (Institute of Environmental Education, National Taiwan Normal University).

Part One:

The Thought and/or Legacy of Aldo Leopold, Rachael Carson, E. F. Schumacher, Nancy Victorian Vangerud, Mosei Lin," ten essays by Nancy Tzu-Mei Chen.

In Search of the Concept of the Harmony between Nature and Man in Traditional China: A Critique," by Dr. Edgar Jun-Yi Lin, Lecture in TESA's Conference (1999).

Part Two: "Introduction to the History of Ecological Ideas in *Nature's Economy* by Donald Worster," six essays by Nancy Tzu-Mei Chen.

Part Three: "Reawakening the Ancient Wisdom, In Search of an Alternative Life," ten essays by Masauli Koung, Eunice Jiang, Esther Jiang, and Nancy Tzu-Mei Chen.

Part Four: "Introducing the Earth Charter: History, Principles and ECYI," translated by Nancy Tzu-Mei Chen.

Part Five: "*Teacher's Guide of the Earth Charter: Bringing Sustainability into the Classroom*," edited by Mohit Mukerjee, translated by Nancy Tzu-Mei Chen.

Conclusion of Volume II: "Taitung, We Are Coming!" by Dr. J. C. Liu.

Chen, Nancy Tzu-Mei, Introduction to TESA Series in Thought and Praxis of Environmental Ethics: Volume IV: *Reconstructing the Ecological Culture in Taiwan*

Introductions to Volume IV by Dr. Jong-Ho Wang (Taiwan Academia Sinica) and Jean-Yi Chen (Association of the Promotion of Land Ethics).

Part One:

Taiwan Christian Ecological Center.

Conference on Ecological Concern.

Taiwan Ecological Stewardship Association.

Core Values of TESA.

Part Two:

Faith and Environmental Ideas Study Group (twenty-four essays of book study report).

Land Ethics Study Group (four essays of book study report).

Part Three: Conference Lectures and Research Papers by Scholars:

The Global Environmental Issues.

The Taiwanese Environmental Problems.

The History of Environmental Protection Movement in Taiwan.

The Water Issues in Taiwan.

Deep Environmental Movement in Taiwan.

Biodiversity and Traditional Wisdom.

The Church of Biodiversity.

After the Kyoto Protocol.

Conclusion of Volume IV: "Caring for the Planet Earth" by Nancy Tzu-Mei Chen.

Chen, Nancy Tzu-Mei, Introduction to TESA Series in Thought and Praxis of Environmental Ethics: Volume III: *The Praxis of Environmental Ethics and Ecological Spirituality in Taiwan*

Introductions to Volume III by Dr. Jen-Wen Wang (Tainan Theological Seminary) and Dr. Sang-Ren Chen (Taiwan Theological Seminary).

Part One: "Global Warming as a Theological Concern," ten essays by Nancy Tzu-Mei Chen.

Part Two: "Renewal of Faith in the Context of Ecological Crisis," ten essays by Nancy Tzu-Mei Chen, one essay by Rev. Ke-Siu Young (former General Secretary of Presbyterian Church in Taiwan), and one essay by Rev. Carver Yu (President of China Graduate School of Theology in Hong-Kong).

Part Three: "Series on Freedom of Simplicity," twelve essays by Nancy Tzu-Mei Chen.

Part Four: "A Mother Who Cares for the Earth and Her Family," twelve essays by Nancy Tzu-Mei Chen.

Part Five: "The Journey to Find the Lost Taiwan Lily," by Ming-Yong Lo (President of TESA)

Part Six: "Introduction to 'The Greening of Religion' in Roderick Frazier Nash's *The Rights of Nature*" (1989), by Nancy Tzu-Mei Chen.

Conclusion of Volume III: "Land Ethics from the Kitchen," by Nancy Tzu-Mei Chen.

Chen, Nancy Tzu-Mei, "Environmental Ethics in Taiwan, Update," *Newsletter, International Society for Environmental Ethics*, vol 19, no. 2, Spring/Summer 2008, pages 36-39.

Cheney, Dorothy L. and Robert M. Seyfarth, How Monkeys See the World. Chicago: University of Chicago Press, 1990. 389 pages. \$ 24.95. The first book to explore the communication and intelligence of these free-ranging primates using field experiments and the theories of modern cognitive science. This book is likely to become the standard reference for biological and behavioral detail in evaluating cognitive theories that compare and contrast humans and monkeys. (v1,#4)

Cheney, Jim, Review of: Calvin Luther Martin, In the Spirit of the Earth, Environmental Ethics 16(1994):321-327.

Cheney, Jim, "Eco-feminism and Deep Ecology," Environmental Ethics 9(1987):115-145. The best of a series of papers on eco-feminism. Cheney shows precisely what is different about a feminist perspective on ecological ethics. It rejects both the model of individual rights/biospherical egalitarianism and the model of extreme holism the supenndividual organism. Feminist ethical thought focuses on relations, and these can be maintained only in a community of care and trust. The modes of individual rights and extreme holism are incapable of taking relationships seriously. Contextual relationships determine ethical worth and value, and the appropriate response to a moral situation. (Katz, Bibl # 1)

Cheney, Jim, and Anthony Weston. "Environmental Ethics as Environmental Etiquette: Toward an Ethics-Based Epistemology." Environmental Ethics 21(1999):115-134. An ethics-based epistemology is necessary for environmental philosophy: a sharply different approach from the epistemology-based ethics that the field has inherited, mostly implicitly, from mainstream ethics. In this paper, we try to uncover this inherited epistemology and point toward an alternative. In section two, we outline a general contrast between an ethics-based epistemology and an epistemology-based ethics. In section three, we examine the relationship between ethics and epistemology in an ethics-based epistemology, drawing extensively on examples from indigenous cultures. We briefly explore several striking implications of an ethics-based epistemology in sections four and five. (EE)

Cheney, Jim, Review of Anthony Weston Back to Earth, Environmental Ethics 18(1996):89-92. (EE)

Cheney, Jim, "The Dusty World: Wildness and Laws in Thoreau's Walden," Ethics and the Environment 1(no. 2, 1996):75-90. To the attentive reader, the high contrast between Thoreau's depiction of a life in conformity to "Higher Laws" and his depiction of Wildness can seem to be yet another endorsement of nature/culture dualism. I argue that while such a dualism frames much of Thoreau's "experiment" at Walden Pond, a deeper understanding of the relationship between Higher Laws and Wildness emerges which is decidedly nondualistic, an understanding for which I invoke the Buddhist image of the Dusty World. I conclude with some reflections on Val Plumwood's recent work on the nature/culture dualisms at work in current discussions about wilderness. Cheney teaches philosophy at the University of Wisconsin-Waukesha. (E&E)

Cheney, Jim, "In the Shadow of Ancient Ruins: Hellenism and Gnosticism in Contemporary Environmental Ethics," special issue: The Moral Sense of Nature, Environmental History Review, vol. 15, no. 2, Summer 1991. (v2,#3)

Cheney, Jim, "Postmodern Environmental Ethics: Ethics as Bioregional Narrative," Environmental Ethics 11(1989):117-134. An ambitious attempt to outline the direction of a postmodern environmental ethic, i.e., an ethic based on the social construction of truth and normative belief. Cheney combines the feminist critique of a universal patriarchal belief system, the development of contextualism, Rolston's concept of "storied residence," McAIntyre's use of narrative in ethical thought, and myth and ritual practice in non-Western communities. The central claim is that bioregional narratives, situated in specific landscapes and places, determine our selves and our communities, and with them, the ethical norms that create healthy lives and societies. The problem here is the relativism of narratives. (Katz, Bibl # 2)

Cheney, Jim, and Karen J. Warren. "Ecosystem Ecology and Metaphysical Ecology: A Case Study." Environmental Ethics 15(1993):99-116. We critique the metaphysical ecology developed by J. Baird Callicott in "The Metaphysical Implications of Ecology" in light of what we take to be the most viable attempt to provide an inclusive theoretical framework for the wide variety of extant ecosystem analyses--namely, hierarchy theory. We argue that Callicott's metaphysical ecology is not consonant with hierarchy theory and is, therefore, an unsatisfactory foundation for the development of an environmental ethic. Cheney is at the Philosophy Dept., University of Wisconsin-Waukesha, Waukesha, WI. Warren is at the Philosophy Dept., Macalester College, St. Paul, MN. (EE)

Cheney, Jim, "The Neo-Stoicism of Radical Environmentalism," Environmental Ethics 11(1989):293-325. Complex account of what Cheney calls the subtext of deep ecology: the task of containing the other by denying difference through a project of cosmological identification and self-realization; the use of intuition isolated from discourse and negotiation; the creation of a totalizing world-view which simultaneously denies otherness and preserves the autonomy of the self. What is required instead is a politics of difference, based on bioregional and historical narratives, with values derived in context and not deduced from a metaphysical vision. Cheney's argument is a plea for a society based on a model of community with difference, not on a model of a unified organism. (Katz, Bibl # 2)

Cheney, Jim, "Truth, Knowledge and the Wild World," Ethics and the Environment 10(no. 2, 2005):101-135. I had hoped for a narrative of storied residence in Midwest prairie, lake, and river country, and in the mountains and deserts of Idaho, with the history of the development of an environmental ethic (or ethos) left largely implicit within that larger narrative, leaving readers to reflect as they may on the philosophical dimensions of the journey. To leave traditional philosophical modes of expression completely behind proved impossible (for now), but it has been for me a worthwhile exercise to locate my reflections on "truth, knowledge, and the wild world" in something of a narrative form. It is the lakes and rivers, prairies, mountains, and deserts that have remained implicit. They have cast their spell, however, on any attempt to impose cultural order on the relationship between truth, knowledge, and wild world. Cheney is in philosophy, University of Wisconsin-Waukesha. (Eth&Env)

Cheney, Jim. "Universal Consideration: An Epistemological Map of the Terrain." Environmental Ethics 20(1998):265-77. I offer an epistemologically grounded revisioning of Tom Birch's ethical principle of universal consideration, suggesting that epistemologies have ethical dimensions and hence that universal moral consideration is intrinsic to the epistemological enterprise. I contrast epistemologies of domination with epistemologies in part constituted by the generosity of spirit that is the hallmark of Birch's notion of universal consideration. Cheney is in philosophy, University of Wisconsin--Waukesha. (EE)

Cheney, Jim. Review of Ecology, Community and Lifestyle: Outline of an Ecosophy. By Arne Naess. Environmental Ethics 13(1991):263-73.

Cheney, Jim. "Callicott's `Metaphysics of Morals.'" 13(1991):311-25. In his campaign against moral pluralism, J. Baird Callicott has attempted to bring "theoretical unity and closure" to environmental ethics by providing a "metaphysics of morals" encompassing environmental, interpersonal, and social concerns,

as well as concerns for domesticated animals. The central notion in this metaphysics is the community concept. I discuss two quite different, and separable, aspects of Callicott's project. First, I argue that his metaphysics of morals does not provide ethical unity and closure. Second, and less specifically focused on Callicott, I discuss the thesis that we can derive ethical obligations from descriptions of the structures of the various communities to which we belong. Cheney is at the Philosophy Dept., University of Wisconsin-Waukesha, Waukesha, WI. (EE)

Cheney, Jim. "Postmodern Environmental Ethics: Ethics as Bioregional Narrative." Environmental Ethics 11(1989):117-34. Recent developments in ethics and postmodernist epistemology have set the stage for a reconceptualization of environmental ethics. In this paper, I sketch a path for postmodernism which makes use of certain notions current in contemporary environmentalism. At the center of my thought is the idea of place: (1) place as the context of our lives and the setting in which ethical deliberation takes place; and (2) the epistemological function of place in the construction of our understandings of self, community, and world. Central to these themes, in turn are the related notions of myth, narrative, storied residence, and ethical vernacular. Cheney is at the Philosophy Dept., University of Wisconsin-Waukesha, Waukesha, WI. (EE)

Cheney, Jim. "The Neo-Stoicism of Radical Environmentalism." Environmental Ethics 11(1989):293-325. Feminist analysis has convinced me that certain tendencies within that form of radical environmentalism known as deep ecology--with its supposed rejection of the Western ethical tradition and its adoption of what looks to be a feminist attitude toward the environment and our relationship to nature--constitute one more chapter in the story of Western alienation from nature. In this paper I deepen my critique of these tendencies toward alienation within deep ecology by historicizing my critique in the light of a development in the ancient world that is disquietingly similar to the rise of deep ecology in recent times namely, the rise of Stoicism in the wake of the breakup of the ancient polis. Cheney is at the Philosophy Dept., University of Wisconsin-Waukesha, Waukesha, WI. (EE)

Cheney, Jim. "Eco-Feminism and Deep Ecology." Environmental Ethics 9(1987):115-45. I examine the degree to which the so-called "deep ecology" movement embodies a feminist sensibility. In part one I take a brief look at the ambivalent attitude of "eco-feminism" toward deep ecology. In part two I show that this ambivalence stems largely from the fact that deep ecology assimilates feminist insights to a basically masculine ethical orientation. In part three I discuss some of the ways in which deep ecology theory might change if it adopted a fundamentally feminist ethical orientation. Cheney is at the Philosophy Dept., University of Wisconsin-Waukesha, Waukesha, WI. (EE)

Cheney, Jim. "Naturalizing the Problem of Evil." Environmental Ethics 19(1997):299-313. I place my analysis and naturalization of the problem of evil in relation to (1) Holmes Rolston's views on disvalues in nature and (2) the challenge posed to theology by environmental philosophy in the work of Frederick Ferré. In the analysis of the problem of evil that follows my discussion of Rolston and Ferré, I first discuss the transformative power for the religious believer of reflection on the problem of evil, using the biblical Job as a case study. I point out difficulties with Job's particular resolution of the problem of evil and suggest that these difficulties can be satisfactorily addressed by naturalizing spirituality. Cheney is in philosophy at the University of Wisconsin-Waukesha, WI. (EE)

Cheng, AS; Kruger, LE; Daniels, SE, "'Place' as an Integrating Concept in Natural Resource Politics: Propositions for a Social Science Research Agenda", Society and Natural Resources 16(no.2, 2003):87-104.

Cheng, Chung-ying. "On the Environmental Ethics of the Tao and the Ch'i." Environmental Ethics 8(1986):351-70. How the Tao applies to the ecological understanding of the human environment for the purpose of human well-being as well as for the harmony of nature is an interesting and crucial issue for

both environmentalists and philosophers of the Tao. I formulate five basic axioms for an environmental ethic of the Tao. (1) the axiom of total interpenetration; (2) the axiom of self-transformation; (3) the axiom of creative spontaneity; (4) the axiom of a will not to will; and (5) the axiom of non-attaching attachment. I show that each axiom generates important consequences for environmental ethics and that together they provide a necessary foundation for environmental ethics. Cheng is in the department of philosophy, University of Hawaii at Manoa, Honolulu, HI. (China)

Cheng, Joseph Y.S. and Zhang Mujin, "Historical Survey and the Cultivation of a New Culture Regarding the Ecology in China's Western Provinces," International Journal of Sustainable Development and World Ecology 11(2004):129-142. Extensive background analysis. China's leadership is giving priority to developing the Western Provinces, where environmental pollution and degradation are worse than in the provinces of the East. Here the blind imitation of the (World) West is striking, but there are Chinese environmentalists who seek a "new ecological culture." This plans for sustainable development and also includes respect for the environment, including intrinsic values in nature. Cheng is with the Contemporary China Research Project, University of Hong Kong. Zhang is at Tsing Hua University, Beijing.

Cherett, J. M., "Key Concepts: The Results to a Survey of Our Members Opinions," in J. M. Cherett, ed, Ecological Concepts (London: Blackwells, 1989), pages 1-16. The fifty most important concepts in ecology, as revealed in a survey of the British Ecological Society. (v4,#2)

Chermak, David S. "Theoretical Environmental Philosophy Is Not Environmental Activism." M.A. Thesis, Colorado State University, 2007. J. Baird Callicott claims that theoretical environmental philosophy is environmental activism, with a strong sense of how by offering good reasons justifying ethical beliefs, ethicists may affect the actions of individuals. Callicott's ethic is grounded in an evolutionary-ecological worldview, which understands humans as a part of the greater biotic community, which leads to the realization that we ought intrinsically to value nature, expanding our moral sentiments. Callicott believes that his environmental ethic demonstrates why individuals ought to value the natural world, and he asserts that his ethic is genuinely normative. Callicott's claim to normativity fails, however, as he is unable to bridge the is/ought gap. There does not seem to be a rationally compelling argument from the evolutionary-ecological worldview to an environmental ethic. Though Callicott's ethic lacks normative force, it remains important in a descriptive sense. Humans naturally grant broaden their identification to include family, friends, and community. Viewing humans as a part of a large biotic community further broadens their identification to include the natural world, as is promoted by deep ecologists. Such an outlook has been a powerful source of motivation for committed environmental activists, although it is not rationally compelling. Bernard Rollin and Holmes Rolston were advisors.

Chernobyl, 10 Years Later. Environment 38, no.3 (1996): 3. On the tenth anniversary of the accident at Chernobyl, a group of distinguished scholars and scientists offers some thoughts on the accident's legacy. (v7, #3)

Chess, Caron; Burger, Joanna; McDermot, Melanie, "Speaking Like a State: Environmental Justice and Fish Consumption Advisories," Society and Natural Resources 18(no.3, March 2005):267-278(12).

Chessa, Frank. "Endangered Species and the Right to Die." Environmental Ethics 27 (2005):23-41. Assuming that both humans and nonhuman organisms have intrinsic value, the concept of a "death with dignity" should extend to the natural world. Recently, an effort has been undertaken to save the razorback sucker, an endangered species of fish in the Colorado River. Razorback are bred and raised in captivity and transferred to the river only when large enough to survive predation by nonnative fish. While this effort is well-intentioned, there is little chance that the razorback will again live unassisted in the Colorado River. There may be human-centered reasons for saving the razorback. However, just as respecting a person sometimes requires limiting his or her life-sustaining medical treatment, so too respecting the razorback may require removing human assistance with its reproductive cycle.(EE)

Chesters, Graeme. Review of Amory Starr, "Naming the Enemy: Anti-Corporate Movements Confront Globalization", Organization and Environment, 15, (No. 2, 2002): 214-17. Chesters is a research fellow in the Centre for Local Policy Studies at Edge Hill University College, UK. (v.13, #3)

Cheyette, Dan. "Breaking the Trail of Broken Promises: 'Necessary' in Section 810 of ANILCA Carries Substantive Obligations," Environmental Law 27(no.2, 1997):611. Chayette examines the U.S. Forest Service's subsistence management policies for the Tongass National Forest in light of section 810 of Alaska National Interest Lands and Conservation Act, which requires federal land management agencies to consider subsistence resources in all land use decisions. He concludes that the Forest Service has ignored the substantive requirements of the statute by managing the Tongass for timber harvesting to the detriment of subsistence resources. Cheyette argues that until the Forest Service creates a new management plan that considers equally all resources of the Tongass, the courts must enjoin timber sales that adversely impact subsistence resources. (v8,#3)

Cheyne, Ilona, "Law and Ethics in the Trade and Environment Debate: Tuna, Dolphins and Turtles," Journal of Environmental Law (Oxford University Press) 12 (no. 3, 2000):293-316. The author's conclusions "throw doubts on the rhetoric of sustainable development ... as an overriding policy framework under which the three human goals of environmental protection, economic welfare ... and social justice can be harmonised. While as a purely empirical matter the three goals may sometimes be combinable, they are essentially incommensurable and competing. Examination of the ethical dimension in particular exposes competing conceptions of sustainability which must be explicitly articulated to prevent protagonists at any level of the trade and environment debate talking past each other" (p. 313).

"There are obvious problems in adopting even enlightened anthropocentric reasons when making decisions that are intended to protect the environment. Policies may be short-lived if human preferences change, or it turns out that human interests are affected detrimentally. There is also the risk of ignoring the value of species with which we have little or no affinity" (p. 314). Cheyne is in law, Newcastle Law School, UK.

Chicago Wilderness: Exploring Nature and Culture. This might seem an oxymoron, but in fact Chicago Wilderness is a magazine and movement with surprising success--so successful that other cities are imitating the program. There are over 220,000 acres of nature preserves in the Chicago area, and more in the region. Several dozen organizations cooperate in educating Chicago people to appreciate the nature and natural history in the region--bird migrants, wildflowers, wetlands, trails, Lake Michigan, the sand dunes. Contact Chicago Wilderness, P. O. Box 268, Downer's Grove, IL 60515-0268. (v.10,#3)

Children, Youth and Environments Vol. 18, no. 1 (2008). The topic of this special issue is "Children and Disasters." Contents include: (1) "Children and Disasters: Understanding Vulnerability, Developing Capacities, and Promoting Resilience—An Introduction" by Lori Peek (pp. 1-29), (2) "Psychological and Physiological Correlates of Stress in Children Exposed to Disaster: Current Research and Recommendations for Intervention" by Inka Weissbecker, Sandra E. Sephton, Meagan B. Martin, and David M. Simpson (pp. 30-70), (3) "The Implications of Climate Change for Children in Lower-Income Countries" by Sheridan Bartlett (pp. 71-98), (4) "Children, Adolescents and the HIV and AIDS Pandemic: Changing Inter-Generational Relationships and Intra-Family Communication Patterns in Botswana" by Klaus Geiselhart, Fred Krüger, and Thando D. Gwebu (pp. 99-125), (5) "Vulnerability of Children and Youth in Drought Disasters: A Case Study of Botswana" by Agnes A. Babugura (pp. 126-57), (6) "A Look at the Standards Gap: Comparing Child Protection Responses in the Aftermath of Hurricane Katrina and the Indian Ocean Tsunami" by Anne Westbrook Lauten and Kimberly Lietz (pp. 158-201), (7) "The School as a Source of Support for Katrina-Evacuated Youth" by Edith J. Barrett, Maria Martinez-Cosio, and Carrie Y. Barron Ausbrooks (pp. 202-36), (8) "Caring for Young Children after a Hurricane: Childcare Workers Reflect on Support and Training Needs" by Samantha L. Wilson and Mary Ann Kershaw (pp. 237-53), (9) "The Role of Children and Youth in Communicating Disaster Risk" by Tom Mitchell, Katharine Haynes, Nick Hall, Wei Choong, and Katie Oven (pp. 254-79), (10) "Displaced Once Again: Honduran Migrant Children in the Path of Katrina" by Marisa O. Ensor (pp. 280-302), (11) "Disaster Resilience and Children: Managing Food Security in Zimbabwe's Binga District" by Siambabala Bernard Manyena, Maureen Fordham, and Andrew Collins (pp. 303-31), (12) "Promoting Child and Family Resilience to Disasters: Effects, Interventions and Prevention Effectiveness" by Kevin R. Ronan, Kylie Crellin, David M. Johnston, Julia Becker, Kristen Finnis, and Douglas Paton (pp. 332-53), (13) "Out of the Floodwaters, But Not Yet on Dry Ground: Experiences of Displacement and Adjustment in Adolescents and Their Parents Following Hurricane Katrina" by Jennifer A. Reich and Martha Wadsworth (pp. 354-70), (14) "Youth Mortality by Forces of Nature" by Sammy Zahran, Lori Peek, and Samuel D. Brody (pp. 371-88), (15) "Disaster Risk Reduction and Vulnerable Populations in Jamaica: Protecting Children within the Comprehensive Disaster Management Framework" by Kerry-Ann N. Morris and Michelle T. Edwards (pp. 389-407), (16) "Caring for Children in the Aftermath of Disaster: The Church of the Brethren Children's Disaster Services Program" by Lori Peek, Jeannette Sutton, and Judy Gump (pp. 407-21), (17) "Hurricane Disaster Response by School-Based Health Centers" by Norma A. Dolch, Daniel L. Meyer, and Angel V. Huval (pp. 422-34), (18) "Garbage to Garden: Developing a Safe, Nurturing and Therapeutic Environment for the Children of the Garbage Pickers Utilizing an Academic Design/Build Service Learning Model" by Daniel Winterbottom (pp. 435-55), (19) "Big Bird, Disaster Masters, and High School Students Taking Charge: The Social Capabilities of Children in Disaster Education" by Tricia Wachtendorf, Bethany Brown, and Macia C. Nickle (pp. 456-69), (20) "After the Tsunami in Cooks Nagar: The Challenges of Participatory

Rebuilding” by Sheridan Bartlett (pp. 470-84), and (21) “Children and Disasters Annotated Resource List” by Sara Gill, Lindsey Gulsvig, and Lori Peek (pp. 485-510).

Chiles, James R., Inviting Disaster: Lessons from the Edge of Technology. New York: HarperBusiness, 2001. Science and technology have made humans ever more powerful, but no less prone to error. Growing technological power and unchanging fallibility invite disaster, as with the Three Mile Island meltdown. But one safety feature is that, though disasters seem to have happened suddenly, often many steps of multiple failures and mistakes lead to disasters, and we can devise detection systems stepwise. Still, we are prone to ignore the early warnings. For some of the most dangerous potential catastrophes, even a tiny risk is intolerably high. (v.13,#1)

Chimpanzee Sequencing and Analysis Consortium, "Initial Sequence of the Chimpanzee Genome and Comparison with the Human Genome," Nature 437(1 Sept. 2005):69-87. The authors note the differences between chimpanzee genes and human genes, focussing on the protein generating genes. Differences are few on overall percentage scales, but considerable on local gene scales. Given the massive size of the sequenced data array, a few percent differences accumulate into millions of differences: thirty-five million single-nucleotide changes, five million insertion/deletion events, and various chromosomal rearrangements. They run various analyses to see what genes in humans and chimps might have been differentially selected. They also frankly recognize that what makes us distinctively human is not yet understood.

"Our close biological relatedness to chimpanzees not only allows unique insights into human biology, it also creates ethical obligations. ... We hope that elaborating how few differences separate our species will broaden recognition of our duty to these extraordinary primates that stand as our siblings in the family of life" (p. 83). The same issue of Nature contains a half dozen related articles, equally puzzled about what makes us human.

Chinese Society of Dialectics of Nature, Nong Ye Zhe Xue Ji Chu (The Basis of a Philosophy of Agriculture), by a Working Group of the Chinese Society of Dialectics of Nature. Beijing: Science Press, 1991. 361 pages. Entirely in Chinese. A contact and one of the working group is Zhang Xiang-gin, Beijing Agricultural University, Beijing China. She is also one of the authors. (China)

Chipeniuk, Raymond, "The Old and Middle English Origins of 'Wilderness'," Environments (Waterloo, Ont.: Faculty of Environmental Studies, University of Waterloo) 21(1991):22-28. Interesting and important article on the roots of the idea of wilderness, which should be read by anyone who has read Roderick Nash. There is a widespread view that until the eighteenth century it was usual for people in the Western tradition to fear and hate wilderness. This view is elaborated by Roderick Nash in Wilderness and the American Mind. But, contrary to Nash, in old English the sense is not always negative; there are many commonsense, neutral, and sometimes positive evaluations of wilderness. There are two possible roots "wil(d)deor," or "wild deer" and "wildeorern," or "wild, uncontrolled or untamed," and "wildeornes" generally meant wild or uncultivated land, inhabited only by wild animals. The word "wild" goes back to Old Teutonic, the precursor of English, long before 450 A.D. In the Bible, the meanings of several words for "wilderness" are not always negative, but they sometimes are, and with the coming of Bible translations these could enter English usage, where wilderness is a frightening and wasted place.

"All in all, the evidence seems to suggest speakers of English have always used the word 'wilderness' ... to mean primarily land not farmed or settled, or ... land inhabited by wild animals. ... Americans do not deserve quite as much credit for elevating wilderness to its current high esteem as Nash and others are wont to give them. Interest in and regard for wilderness as the home of abundant wildlife was the heritage of the English-speaking world from its beginnings." Chipeniuk has degrees in English

language and literature from McGill University and the University of Toronto, and works in regional planning with an interest in wilderness. (v7,#1)

Cho, Hong Sik. "An Overview of Korean Environmental Law." Environmental Law. 29(No. 3, 1999): 501- . Severe environmental harms have forced the Korean people to reevaluate the balance between industrialization and environmental protection in Korea. Korea has reached a point in its economic development where its people have begun to evaluate their surroundings and quality of life as affected by the environment. Hong Sik Cho recommends that other developing nations take a serious look at Korea's current challenge of balancing economic prosperity with environmental protection and that they learn from Korea's experience. (v10,#4)

Cho, Mildred K., Magnus, David, Caplan, Arthur L., McGee, Daniel, and the Ethics of Genomics Group, "Ethical Considerations in Synthesizing a Minimal Genome," Science 286(1999):2087-2090. Efforts to create a free-living organism with a minimal genome are underway, although the prospects of so doing are rather far off. Such an organism would have the minimal genome that allows for replication in an environment, estimated at 256 genes. The research may give insight into the origins of life and into more complex genomes, as well as have applications in genetic engineering. "The prospect of constructing minimal and new genomes does not violate any fundamental moral precepts or boundaries, but does raise questions that are essential to consider before this work advances further." "The dominant view is that, while there are reasons for caution, there is nothing in the research agenda for creating a minimal genome that is automatically prohibited by legitimate religious considerations." (v10,#4)

Chomitz, K. M. *At Loggerheads? Agricultural Expansion, Poverty Reduction, and Environment in the Tropical Forests*. Washington, DC: World Bank, 2007. This is also in Spanish, Indonesian, French, and Portuguese, and a free down-loadable version is available online at <www.worldbank.org/tropicalforestreport>. This is essentially an economic study, with models to analyze the tradeoffs, necessary and unnecessary, between agriculture and forest conservation. People clear forests because they profit from doing so, sometimes substantially and sometimes not, but all too often the private gains are ephemeral, whereas the public losses are severe and enduring. The aim is to formulate policies with optimal tradeoffs between profit-making and nature protecting, with much poverty, geography and corruption, and biodiversity and population pressure en route. This is an excellent treatment of the globally critical issue of tropical forest conservation. The author argues for carbon payments for avoided deforestation.

Choosing a Sustainable Future: The Report of the National Commission on the Environment. Washington, DC: Island Press, 1993. The report of a private sector initiative convened by the World Wildlife Fund. Nineteen prominent members. "We the members of the National Commission on the Environment, are convinced that the natural processes that support life on Earth are increasingly at risk and that by choosing to act or not to act to confront this risk now, our country is choosing between two very different futures" (p. xi). Russell E. Train, Chair, World Wildlife Fund and former Environmental Protection Agency (EPA) Administrator and Council on Environmental Quality Chair (CEQ) was the chair of the commission. (v4,#2)

Chornesky, Elizabeth A. et al., "Science Priorities for Reducing the Threat of Invasive Species to Sustainable Forestry," BioScience 55(no.4, April 2005):335-349(15). Invasive species pose a major, yet

poorly addressed, threat to sustainable forestry. Here we set forth an interdisciplinary science strategy of research, development, and applications to reduce this threat. To spur action by public and private entities that too often are slow, reluctant, or unable to act, we recommend (a) better integrating invasive species into sustainable forestry frameworks such as the Montreal Process and forest certification programs; (b) developing improved cost estimates to inform choices about international trade and pest suppression efforts; and (c) building distributed information systems that deliver information on risks, identification, and response strategies. To enhance the success of prevention and management actions, we recommend (a) advancing technologies for molecular identification, expert systems, and remote sensing; (b) evolving approaches for ecosystem and landscape management; and (c) better anticipating interactions between species invasions and other global change processes.

Choucri, Nazli, ed., Global Accord: Environmental Challenges and International Responses. Cambridge: MIT Press. 688 pages. \$ 45.00. Fifteen essays on how individuals, groups, and nations create environmental dislocations and can work together to solve ecological problems that cross their borders. Choucri is professor of political science at the Massachusetts Institute of Technology. (v4,#2)

Chow, Jeffrey, Kopp, Raymond J., and Portney, Paul R., "Energy Resources and Global Development," Science 302(2003):1528-1531. "In order to address the economic and environmental consequences of our global energy system, we consider the availability and consumption of energy resources. Problems arise from our dependence on combustible fuels, the environmental risks associated with their extraction, and the environmental damage caused by their emissions. Yet no primary source, be it renewable or nonrenewable, is free of environmental or economic limitations. As developed and developing economies continue to grow, conversion to and adoption of environmentally benign energy technology will depend on political and economic realities."

The world does not seem to be running out of mineral fuels, but using these fuels intelligently, justly, and without degrading the environment is a much tougher question, and not currently being adequately addressed. The authors are with Resources for the Future, Washington, DC.

Christ, Carol P. and Kathryn Rountree. "Humanity in the Web of Life." Environmental Ethics 28(2006):185-200. The humanity-nature divide is a modern Western construction based on the notion that matter (nature) is dead, while consciousness (humanity) is alive, rational, and positioned to use matter (nature) to achieve its ends. In contrast, in the world views of the indigenous MaFori of New Zealand and Aborigines of Australia, nature is not separate from humanity and all is infused with consciousness. The ecofeminist and Goddess movements which emerged in the last decades of the twentieth-century, share with many indigenous religions the perception that all of nature is alive and that human beings must respect other beings within the web of life. Yet these are postmodern rather than premodern movements with an explicit critique of the assumptions of modernity. Process philosophy, especially when understood through the "feminist process paradigm" proposed here, is a postmodern philosophical system that affirms the insights of indigenous peoples, as well as Goddess and ecofeminists, that humanity must situate itself within the web of life. At the same time, process philosophy provides the tools for reconciling "premodern" insights with the findings (but not the assumptions) of modern science. Each of these resources can help us to provide alternatives to the humanity-nature divide. (EE)

Christensen, Harriet H. and Daniel L. Dustin, "Reaching Recreationists at Different Levels of Moral Development," Journal of Park and Recreation Administration 7(no. 4, Winter 1989):72-80. Illustrations of interpretive signs and other appeals in environmental ethics directed toward persons at different levels of moral development. Differences between Lawrence Kohlberg and Carol Gilligan on what these levels are and the consequent appeals. Especially at the higher levels, men are characterized by an ethic of justice, fairness, and self-respect, women by an ethic of reference and relation to self and others, with caring the highest value. Christensen is a social scientist with the U. S. Forest Service Pacific Northwest Research Station, Seattle. Dustin is a professor in the Department of Recreation at San Diego State University. Ciesla, William A., "Ethics in Photogrammetry and Remote Sensing: A Perspective from a Natural Resource Specialist," Photogrammetric Engineering and Remote Sensing 57(no. 3, March 1991):281-282. Resource managers now face much more complex decisions than before, owing to the intense conflicts in society over which values are to be pursued in environmental management, across a spectrum from more economic output and stability to concern for the other organisms with whom we share the planet. Technicians in photogrammetry and remote sensing have an obligation to take great care to present reliable and unbiased results to society, as a basis for social decisions. They ought not to cloud their conclusions with personal bias. Also, they ought not to overestimate the powers of technology. Following Leopold's land ethic, they also need continually to re-evaluate their "ground truth," that they have a responsibility and role in helping society to manage and protect the resources on which we depend for the common good of our planet and future generations. Ciesla is with the USDA Forest Service, Pacific Northwest Region, Portland, OR.

Cifric, Ivan, "Anthropocentrism and Naturalism--Bases of Modern Thought?" Socijalna Ekologija:

Casopis za ekolosku misao i sociologijska istrazivanja okoline (Social Ecology: Journal for Environmental Thought and Sociological Research) 4(1995):5-34. Published in Zagreb, Croatia. The journal is ordinarily published in Croatian, some articles in German or French, but some issues are in English, as is this one. Based on a study of the convictions of Croatian students, finding and analyzing two main bases of modern thought. The first relies on anthropocentrism, is optimistic, supports progress, projects development. The second is pessimistic, relies on naturalism, and from a moral standpoint contests the existing progress of civilization, advocates saving natural resources, and sees a catastrophic future. Cifric is in the faculty of philosophy, Department of Sociology, University of Zagreb. Other articles in this issue on progress and politics, attitudes toward nuclear power plants, radioactive wastes, and the sense of the quality of life. (v8,#3)

Cifric, Ivan, "Development and Environmental Protection in Croatia," Socijalna Ekologija (Journal for Environmental Thought and Sociological Research) (Zagreb, Croatia) 4(nos. 2-3, 1995):149-170. Most of those surveyed see environmental problems as quite serious and are pessimistic about improvements in the next ten years. But men, religious persons, those who identify with a political party, and those with living standards above average expect more progress, especially after ten years. Depending on the region of Croatia, 19% to 36% think there will be no improvement, and those who favor market models expect that environmental protection will degrade even more. Cifric is on the philosophy faculty at Zagreb. (v6,#4)

Cifric, Ivan. "Relation between Socioenvironmental Orientations and Religious Belief." Socijalna ekologija (Social Ecology: Journal for Environmental Thought and Sociological Research) 4(1995):15-33. (published by the Faculty of Philosophy, Department of Sociology, University of Zagreb, Croatia. In Croatian, with paper summary in English and German. Comparing surveys in 1988 and 1992, there was a decrease in anthropocentric beliefs and an increase of desire for natural balance, though believers in formal congregations were more anthropocentric. Cifric is in philosophy at the University of Zagreb. (v6,#3)

Clark Ann E. and Hugh Lehman, "Assessment of GM Crops in Commercial Agriculture," Journal of

Agricultural and Environmental Ethics 14(2001):3-28. The caliber of recent discourse regarding genetically modified organisms (GMOs) has suffered from a lack of consensus on terminology, from the scarcity of evidence upon which to assess risk to health and to the environment, and from value differences between proponents and opponents of GMOs. Towards addressing these issues, we present the thesis that GM should be defined as the forcible insertion of DNA into a host genome, irrespective of the source of the DNA, and exclusive of conventional or mutation breeding.

Some defenders of the commercial use of GMOs have referred to the scientific work of GMO critics as "junk science." Such a claim is false and misleading, given that many papers critical of both the utility and safety of GMOs have been published in peer reviewed journals by respected scientists. In contrast, there is a dearth of peer reviewed work to substantiate the frequently heard assertions of either safety or utility in GMOs. The polarity, which now characterizes much of the public discourse on GMOs, reflects not simply scientific disagreement, but also disagreement in underlying value assumptions. Value differences strongly affect the assessment of both benefit and harm from GMOs.

The concept of substantial equivalence occupies a pivotal position in the GMO risk assessment process that is used in both Canada and the US. A GMO judged to be substantially equivalent to a conventional product - as have all submissions to date - is presumed to be safe enough for commercialization. The conclusion of safety - from both human health and environmental perspectives - should be based on scientific evidence, corroborated by actual experimentation. However, regulators infer safety largely from assumptions-based reasoning, with little or no experimental validation. The judgement of safety because of substantial equivalence is a dubious argument by analogy. Keywords: biotechnology, genetic engineering, junk science, risk assessment, substantial equivalence. Clark and Lehman are in the Department of Plant Agriculture, University of Guelph, Guelph, Ontario, Canada. (JAEE)

Clark, Brett, "Ebenezer Howard and the Marriage of Town and Country: An Introduction to Howard's 'Garden Cities of Tomorrow'", Organization and Environment, 16, (No. 1, 2003): 87-97. An introductory examination of how Ebenezer Howard advocated the construction of garden cities to reduce the alienation of human society from nature. Howard insisted that the long term sustainability of garden cities was founded on abiding by the law of restitution, where all wastes were recycled back to the soil to ensure the continued productive potential of the land. In this, Howard's garden cities dissolved the town-country divide and provided a model for an ecologically sustainable society. Clark is a sociology doctoral student at the University of Oregon.

The authors provide an introduction to the environmental and social thought of Helen Keller, with its radicalism and invocation of the use of the sensory domain, as an introduction to some extended extracts from her work. Clark is a sociology doctoral student at the University of Oregon. Foster is a professor of sociology at the University of Oregon. (v.13, #3)

Clark, Brett., "The Indigenous Environmental Movement in the United States: Transcending Borders in Struggles Against Mining, Manufacturing, and the Capitalist State". Organization and Environment, 15, (No. 4, 2002): 410-442. Sociql Movement theory emphasizes the importance of resource mobilization

and the strategic political processes of struggles within a society. This critical essay argues that although it yields useful insights into the dynamics involved in a struggle, social movement theory ultimately is too narrow to grapple with all social struggles. The indigenous environmental movement breaks the mould, revealing unconsidered historical forces and variables involved in social struggles. The economic dynamics of capitalism and the history of internal colonialism must be incorporated into an account of the evolution of the indigenous environmental movement. Struggles over treaty rights and sovereignty are unique to the Native population, making their movement one of the most powerful and effective groups for protecting the environment. Although the indigenous environmental movement is connected to other environmental movements, the Native struggle remains fundamentally grounded in a challenge to the whole of society, as presently constituted, as they fight for the survival of their nations and ways of life. Brett Clark is a sociology doctoral student at the University of Oregon with research interests in ecology, political economy and imperialism.

Clark, Brett. Review of Adam S. Weinberg, David N. Pellow & Allan Schnaiberg, "Urban Recycling and the Search for Sustainable Community Development", Organization and Environment 14 (No. 1, March 2001) pp.120-24. Clark is a sociology doctoral student at the University of Oregon. (v.13,#2)

Clark, E. Ann, "Resolving Conflicting Priorities in Ontario Agriculture", Journal of Agricultural Ethics 1(1988):275-289. Enhancing the viability of nontraditional farm operations, an historically neglected component of the farming community, as well as commercial farms is viewed as one approach to sustaining and improving both the agricultural land base and the agricultural community. Applying resource-extensive rather than resource-intensive approaches to forage management reveals that these apparently divergent priorities are, in fact, interlocking pieces of the same puzzle. Clark is in crop science at the University of Guelph, Ontario.

Clark, E. Ann & Christie, B. R., "A Forage-Based Vision of Ontario Agriculture", Journal of Agricultural Ethics 1(1988):109-121. The necessity of incorporating societal and environmental concerns into publicly funded agricultural initiatives in research, extension, and practice is increasingly evident. Agriculturalists are urged to acknowledge and respond to societal concerns before an insensitive and largely ill-informed urban majority assumes a dominant posture in agricultural policy. Clark and Christie are in crop science at the University of Guelph, Ontario.

Clark, Eric, "The Ballad Dance of the Faeroese: Island Biocultural Geography in an Age of Globalisation," Tijdschrift voor Economische en Social Geografie 95(no. 3, 2004):284-297. In English. The Ballad Dance of the Faeroese (connected with local identity and whale slaughter) is taken as an example of cultural diversity blended with biodiversity, and the Faeroe Islands an example of a distinctive island culture encountering globalisation. What to make of boundaries, of island-ness in a global age? Historical studies of island biocultural geographies provide promising means for probing ties between biological and cultural diversity and enhancing our perceptions of co-evolution under globalisation. Clark is in the Department of Social and Economic Geography, Lund University, Lund, Sweden.

Clark, John P., "Marx's Inorganic Body," Environmental Ethics 11(1989):243-258. Marx's philosophy of nature does not include an ecological perspective. In the Grundrisse, "Marx repeatedly stresses the theme that historical progress depends on a continual expansion of the human domination of nature" (253). Marx humanizes, but perpetuates, the nonecological dualisms of pre-ecological thought: anthropocentrism, instrumental rationality, and technological liberation. (Katz, Bibl # 2)

Clark, John P. "Marx's Inorganic Body." Environmental Ethics 11(1989):243-58. Attempts to find an authentically ecological outlook in Marx's philosophy of nature are ultimately unsuccessful. Although Marx does at times point the way toward a truly ecological dialectic, he does not himself follow that way. Instead, he proposes a problematic of technological liberation and mastery of nature that preserves many of the dualisms of that tradition of domination with which he ostensibly wishes to break. Clark is at City College, Loyola University, New Orleans, LA. (EE)

Clark, John, "How Wide is Deep Ecology?" Inquiry 39(no. 2, June, 1996):189-201. "Arne Naess's 'rules of Gandhian nonviolence' might usefully be applied to recent debates in ecophilosophy. The 'radical ecologies' have increasingly been depicted as mutually exclusive alternatives lacking any common ground, and many of the hostile and antagonistic attitudes that Naess cautions against have become prevalent. Naess suggests, however, that fundamental differences concerning theory and practice can coexist with a respect for one's opponents, an openness to the views of others, and a commitment to cooperation in the pursuit of mutually held goals. I raise questions about the scope of deep ecology in the light of Naess's non-ideological, 'deep-questioning' approach. First, I ask whether an expanded consideration of the social institutional implications of deep ecology would not increase its depth, relevance and appeal to proponents of other ecologies. Second, I pose the question of whether certain tendencies to define deep ecology in stark opposition to other ecophilosophies have not impeded the original aims of the movement. And, finally, I suggest that possible answers to these questions are implicit in Arne Naess's ecophilosophy." Clark is at Loyola University, New Orleans. (v8,#3)

ABSTRACT: Apparent conflicts between human jobs and welfare and the interests of wildlife can frequently be resolved if man is perceived as part of Nature rather than in opposition to it. However, social and scientific paradigms emphasize individuality at the expense of connectedness, and competition at the expense of co-operation. Ecologists are well placed to address the important questions of how fast human societies can adapt to change, which cultures are most adaptable, and how satisfactory given adaptations are likely to prove in the longer term. A new perception of time is needed, with serious questioning of such practices as discounting the future. Ecologists may be able to help predict the long-term effects of climate change, not only on the environment, but also on human social systems.

Clark, Stephen R. L., Biology and Christian Ethics. Cambridge: Cambridge University Press, 2000. Clark is concerned to challenge those who claim too much in the name of science, to unmask the ideological commitments of those who imagine that they carry none. By reducing ethics simply to evolutionary or sociobiological impulses, writers such as Richard Dawkins and E. O. Wilson produce a highly distorted account of what it is to be moral, let alone a religious human being. They proffer a highly questionable series of "scientific" explanations.

Clark is further concerned to challenge scientists and theologians alike. Many of us have a deeply distorted and contradictory relationship with other animals. In Clark's theological account of creation all animals are our neighbors. Scientists should not regard animals as the proper subject of experiments, or of biotechnological manipulations, and the rest of us should not eat them. Instead, we should learn to value and respect them as neighbors who share to a greater or lesser degree many of the qualities and capacities that we regard as characteristically human. Clark has a theological commitment to both ecology and vegetarianism. Clark is in philosophy at the University of Liverpool, UK. (v.13,#2)

Clark, Stephen R. L., "Natural Goods and Moral Beauty," pages 83-97 in Knowles, Dudley and Skorupski, John, eds., Virtue and Taste: Essays on Politics, Ethics and Aesthetics, vol. 2 in the Philosophical Quarterly Supplementary Series. Oxford: Basil Blackwell, 1993. "How can animals set us good examples of how to behave, without being moral agents? About as easily, I might reply, as they can set us good examples in engineering, without being technologists." (p. 85). Animals do not intend to do beautiful things, but their engineering and survival constraints result in their doing beautiful things, and humans with their aesthetic capacities can discover this objective beauty in the world. "My own conclusion is that the Beautiful is indeed a constraint on what can happen, and that natural selection and engineering efficiency have generated--because they were so intended--creatures that can look directly toward the Beautiful, and not merely at its reflection and shadow, natural good. There is indeed a Beautiful that does not die, and all that passes beautifully in the long nightmare of our present living is eternal There" (pp. 94-95). Clarke, Melissa, "Ontology, Ethics, and Sentir: Properly Situating Merleau-Ponty," Environmental Values 11(2002):211-225. Maurice Merleau-Ponty did not author an ethic, and yet it is possible to extend his ontological descriptions to an ethic similar to that espoused by post modern thinkers. It is even possible to distill an environmental ethic, or at least, one of consideration of the more-than-human, from his work. This paper attempts to do some preliminary work in light of this, and lays some groundwork for the future direction of an environmental ethic inspired by a Merleau-Pontian ontology. At the same time, it challenges the popularized view of Merleau-Ponty espoused by David Abram--viz., of Merleau-Ponty as an animist--and properly situates Merleau Ponty. (EV)

Claro,Edmundo, "Exchange Relationships and the Environment: The Acceptability of Compensation in the Siting of Waste Disposal Facilities," Environmental Values 16(2007):187-208. Within siting literature there is strong agreement that compensation for environmental risks is a necessary condition for local acceptance of waste treatment facilities. In-kind compensation is commonly pushed forward as being more effective than financial benefits in reducing local opposition. By focusing on the siting of a sanitary landfill in Santiago, Chile, this paper explores the performance of both types of compensation and relates the analysis to the notion of social norms of exchange. These are understood as being based on three main types of social relations: care, justice and freedom. Whereas monetary compensation is associated with market relations based on freedom and the offer of in-kind compensation to egalitarian relations based on justice, the absence of compensation is linked to fraternal relations based on care. It is argued that in-kind compensation is more acceptable than monetary payments or no compensation because people tend to understand siting conflicts more as matters of justice rather than as matters of freedom or care. Claro lives in Santiago, Chile.

People and organizations need to work together to solve problems and potential crises facing the environment. (v.12,#2)

Claxton, Guy, "Involuntary Simplicity: Changing Dysfunctional Habits of Consumption." Environmental Values 3(1994):71-78. Why is it so difficult for 'voluntary simplicity' to become truly voluntary? It is suggested that an important distinction has to be made between beliefs which are 'espoused' and those which are 'embodied'. Certain crucial systems of embodied beliefs constitute traps, in the sense that they set, invisibly, a person's motivational agenda, and bias perception against their own detection. This analysis makes it clear why certain popular forms of campaigning and education are ineffective; and suggests that some methodologies of self-transformation associated with spiritual traditions such as Buddhism may have much to offer the environmental movement. KEYWORDS: Beliefs, motivation, perception, psychology, voluntary simplicity. Claxton is in education at the University of Bristol, U.K. (EV)

Clifford, Hal, Downhill Slide: Why the Corporate Ski Industry is Bad for Skiing, Ski Towns, and the Environment. San Francisco: Sierra Club Books, 2002. Fueled by mergers and buyouts, America's corporate ski resorts are more about real estate than ski runs. Skiing morphed from a more or less environmentally benign outdoor experience into a destructive, extractive industry. The ski industry depends on U.S. Forest Service co-operation (also interested in the monetary gains), demands both forests and water and power to make snow. A major resort spends \$ 1 million annually on its power bill for snowmaking and resorts will (if they can) drain the rivers at their lowest flow in winter, adversely affecting riparian ecology. But the money is not made from skiing. The real money is made at the bottom of the ski runs, in the glitzy real estate, now sprawling widely across the valleys below the runs, and also demanding consumption of natural resources, straining the support capacities of the montane ecosystems. Clifford lives in Telluride, Colorado.

Clines, Francis, "Mining Deep underground Stirs Protest Above," New York Times (5/4/01): A14. Subsistence from coal mining stirs debate. Underground coal mining in Pennsylvania involves a slow but relentlessly moving "longwall" that produces miles of slag 7 feet high and 1,000 feet wide underground caverns. Frequently the above ground topography drops 3 or 4 feet, resulting in cracked houses, altered streams, and disappearing water wells. In 1999, about 60% of undermined structures were damaged. State law requires compensation and homeowners are given a range of damage-control and buyout options. But they question why they have to tolerate this destruction in the first place.

Legally the coal industry seems to be on firm ground, for mining rights were usually sold by earlier owners around 1900 and they stipulated the owners' obligation to acknowledge the coal companies' undermining rights. A coal company spokesperson maintains that repair and compensation for damaged structures have been adequate and describes the effects of subsistence on people's homes as "sort of like having your bathroom and kitchen done at the same time." Recent studies of the environmental effects of the longwall suggest significant effects on streams, springs, and wetlands. Critics claim the sediment

from longwall mining is a major pollutant of streams negatively affecting breeding grounds of various species, disrupting food webs, and reducing oxygen levels. The coal company spokesperson argues that any damage is temporary and that change, far from being necessarily bad, can even be an enhancement. He dismisses the critics as "a small group of people trying to mount a modern fight against an economic fact of life that is two centuries old." The Pittsburgh seam, one of the richest in the U.S., yields 23 tons of coal a minute and has about 50 years worth of coal left. (v.12,#4)

Clingerman, Forrest. "Beyond the Flowers and the Stones: Emplacement and the Modeling of Nature." *Philosophy in the Contemporary World* Vol. 11, no. 2 (2004): 17-24. Clingerman argues that modeling nature by using Paul Ricoeur's concept of emplacement can help solve some of the problems in defining nature.

Cobb, John B., Jr., The Earthist Challenge to Economism: A Theological Critique of the World Bank. New York: St. Martins, 1999. 192 pages. \$ 65.00. A penetrating critique of the World Bank in development and environmental conservation, because Cobb hopes that, troublesome though the Bank has been and is, it will "lead the world beyond economism to earthism." History has moved through a series

of epochs, each ordered by a dominant social institution. Each such social institution has developed an ideology that functions as that society's "shared religion." The excesses of this ideology lead to the demise of the dominant institution and the rise of another.

In the medieval period the church governed, and came to dominate with an inordinately self-serving ideology. Social power and authority shifted to the state, and nationalism developed with its own self-aggrandizing tendencies, substituting for religion. Power has now shifted to economic institutions, notably the European Economic Community/Union, the International Monetary Fund, The World Bank, and the World Trade Organization. The assumption is that all people will be better off if market forces replace national policies--economism. But economism is destined increasingly to bring about its own ideological and institutional demise. What's next? Earthism. Earthists "see the health of the Earth, including its human inhabitants, as of supreme importance." Economism, ideologically degenerating, implies that the poor will get poorer and natural environments will continue to be degraded, and consumerism in developed nations will escalate. We ought all to become earthists, and so can, and ought, the World Bank. Cobb analyzes how. He even applauds the bank's current president, James Wolfensohn, for espousing the kinds of values and pushing the bank to embody the kinds of funding priorities that could demonstrate "an earthist paradigm for development." Cobb is emeritus, Claremont School of Theology. (v.10,#2)

"Is It Too Late? was one of the very few pioneering works in ecological ethics and theology. It remains richly relevant, indicative of the author's seminal insight and foresight. ... Although written for a general audience, it is also an essential resource for ecophilosophers and ecotheologians." -- James A. Nash, The Churches' Center for Theology and Public Policy. Cobb is professor of philosophy at the School of Theology at Claremont. (v6,#1)

Cobb, John, Jr. "Christian Existence in a World of Limits." Environmental Ethics 1(1979):149-58. The new awareness of limits profoundly challenges dominant habits of mind and styles of life. Although Christians have largely adopted these now inappropriate habits and styles, the Christian tradition has resources for a more appropriate response. Among these resources are Christian realism, the eschatological attitude the discernment of Christ, the way of the cross, and prophetic vision. Finally, faith offers freedom from the burden of guilt of failing to live in a way appropriate to our newly perceived reality. Cobb is at the School of Theology and Claremont Graduate School, Claremont, CA. (EE)

Cobb, John B., Jr., Sustaining the Common Good: A Christian Perspective on the Global Economy. Cleveland, OH: Pilgrim Press, 1995. 128 pages. \$ 12.95. Globalization is destroying our capacity to maintain vital human communities. To avoid catastrophe, we must decentralize by adopting policies that promote relatively self-sufficient local economies. The scale of economic activity in today's world already exceeds that which ought to prevail in a world that limits its uses of resources to sustainable levels. We are robbing future generations in order to improve conditions for ourselves. The self-interested behavior of buyers and sellers in most markets today is an almost insurmountable barrier to the

task of building vital human communities. When workers and owners of capital are taught to seek the largest possible return for their efforts, they make possible the specialization and productivity for which laissez-faire capitalism is famous, but at the expense of constant disruption to the fabric of community. Theologically, Cobb faults the existing economic system for focusing primarily on human production rather than on creation, putting God's gifts of nature at considerable risk of degradation. The Earth is God's and degrading it is evil, a result of economism as an idolatry. Cobb is a well-known theologian, retired from Claremont Graduate School. (v6,#4)

Probably the principal paper available for assessing the power and prospects for Christianity as a force for environmental conservation, as well as for human development, in South Africa. The author has also formed, with Eddie Koch of the Johannesburg Weekly Mail, GEM, Group for Environmental Monitoring, that seeks to do research in and provide education for environmental issues in South Africa, especially as this affects those who have been the victims of apartheid. (v2,#4)

Cock, Jacklyn. *The War Against Ourselves: Nature, Power and Justice*. Johannesburg: Wits University Press, 2008. Cock claims that we need to reexamine human relationships with nature by questioning binary divisions such nature vs. culture, people vs. animals, and economic growth vs. environmental protection. She argues that we need a new inclusive politics to bring social and environmental justice together with peace.

Cockell, Charles S. "The Value of Microorganisms." Environmental Ethics 27 (2005):375-390. Environmental Ethics has almost exclusively been focused on multicellular organisms. However, because microorganisms form the base of the world's food chains, allowing for the existence of all higher organisms, the complexities of the moral considerability of microorganisms deserve attention. Despite the

impossible task of protecting individual microorganisms—the paradigmatic example of the limitations to a Schweitzerian "reverence for life"—microorganisms can be considered to have intrinsic value on the basis of conation, along with their enormous instrumental value. This intrinsic value even manifests itself at the individual level, although in this case the ethic can only be regulative (an ethical principle). Biocentrism is the most appropriate ethical framework for microorganisms, and the most useful normative framework for implementing the preservation and conservation of microorganisms. This ethic has implications for how we deal with disease-causing microorganisms. (EE)

Cockell, Charles S., "The Rights of Microbes," Interdisciplinary Science Reviews 29(2004):141-150. "A strong case can be made for microorganisms to be accorded special ethical status, as they represent the base of all food chains and of the major biochemical cycles. Without life there is no life, but without microorganisms there can be no higher life forms. The notion of protecting individual microorganisms may be absurd, but microbial communities and ecosystems nevertheless deserve protection, and offer an example of the merits of a population based approach to environmental ethics. I argue that humankind should assume the position of a moral agent to the microbial world, by formally recognizing the intrinsic worth of microorganisms, as well as their utilitarian value to humans and to the rest of life on earth. The practical implications of such an ethic are discussed." Cockell is with the British Antarctic Survey, Cambridge, UK.

Cockell, Charles S. "The Ethical Relevance of Earth-like Extrasolar Planets." Environmental Ethics 28(2006):303-314. The discovery of Earth-sized extrasolar planets orbiting distant stars will merit an expansion of the sphere of entities worthy of moral consideration. Although it will be a long time, if ever, before humans visit these planets, it is nevertheless worthwhile to develop an environmental ethic that encompasses these planets, as this ethic reflects on our view of life on Earth and elsewhere. A particularly significant case would be a planet that displays spectroscopic signatures of life, although the discovery of many lifeless planets might itself intensify the value of life on Earth. A derivation of Schweitzer's general principle of "reverence for life" and similar frameworks are appropriate ethics with which to view extrasolar planets. The development of an ethical framework for extrasolar planets might provide a means to fashion a deeper and more effective environmental ethic for Earth's biosphere. (EE)

Cockell, Charles S., "Environmental Ethics and Size," *Ethics and the Environment* 13(no. 1, 2008):23-39. Environmental policy has a size bias. Small organisms, such as microorganisms, command less attention from environmentalists than larger organisms, such as birds and large mammals. A simple thought experiment involving microscopic polar bears and giant microorganisms illustrates the importance of size in environmental ethics. Given the positive correlation between body size and brain size, there is probably a basis for a size bias in environmental ethics using ethical frameworks based on conations. This paper examines the relevance of the size of organisms in environmental ethics. It emphasizes the need to understand the theoretical reasons for the importance of size, and not to base a size bias merely on a subjective anthropocentric prejudice favouring large organisms. Charles Cockell is Professor of Microbiology at the Open University, UK

Code, Lorraine, *Ecological Thinking: The Politics of Epistemic Location*. Oxford Univ Press, 2006. How could ecological thinking animate an epistemology capable of addressing feminist, multicultural, and other post-colonial concerns? Starting from an epistemological approach implicit in Rachel Carson's scientific practice, Code elaborates the creative, restructuring resources of ecology for a theory of knowledge. Drawing on ecological theory and practice, on naturalized epistemology, and on feminist and post-colonial theories, Code analyzes extended examples from developmental psychology, and from two "natural" institutions of knowledge production—medicine and law. These institutions lend themselves well to a reconfigured naturalism. They are, in practice, empirically-scientifically informed, specifically situated, and locally interpretive. With human subjects as their "objects" of knowledge, they invoke the responsibility requirements central to Code's larger project. Code is Distinguished Research Professor, York University, Toronto

Code, Lorraine. "Flourishing," Ethics and the Environment 4(1999):63-72. Commentary on Chris Cuomo, and puzzles about the metaphor of "flourishing," central in Cuomo's book title: Feminism and Ecological Communities: An Ethic of Flourishing" (London: Routledge, 1998). (E&E)

Codling, Rosamunde, "Concepts of Wilderness in the Antarctic," International Journal of Wilderness 3 (no. 3, 1997):35-39. Tourists visiting by ship carry their accommodation and their means of propulsion with them, but while they may be spectators to the wilderness that is the land, they live and move through the wilderness that is the sea. Wilderness needs to be seen in a global context, as part of a continuum of human impact that begins with highly urban areas and ends with remaining pristine regions. Codling is a landscape planner, Scott Polar Research Institute, Cambridge University. (v.8,#4)

Coglianesse, Cary, "The Limits of Consensus: The Environmental Protection in Transition: Toward a More Desirable Future," Environment 41 (no. 3, 1999):28-33. Efforts to develop consensus-based recommendations in environmental policy through a series of dialogues with leaders from industry, government, think tanks, and environmental groups are floundering. It will help to get clear on the limits of consensus in the development of environmental policy. Coglianesse is in Public Policy, John F. Kennedy School of Government, Harvard. (v.10,#2)

Coglianesse, Cary. "Implications of Liberal Neutrality for Environmental Policy." Environmental Ethics 20(1998):41-59. The principle of liberal neutrality requires governments to avoid acting to promote particular conceptions of the good life. Yet by determining who uses natural resources and how, environmental policy makers can affect the availability of resources needed by individuals to carry on meaningful lives and in doing so can effectively privilege some versions of the good life at the expense of others. A commitment to liberal neutrality by implication promotes environmental policy that accommodates competing activities in order to provide a wide range of resources that can support

diversity in individual lives. It also encourages caution with regard to legislation based on deep ecology, the intrinsic value of species, and the fear of impending environmental catastrophe. Coglianese is at Harvard University, School of Government. (EE)

Cohen, Andrew I., "Dependent Relationships and the Moral Standing of Nonhuman Animals," *Ethics and the Environment* 13(no. 2, 2008):1-21. This essay explores whether dependent relationships might justify extending direct moral consideration to nonhuman animals. After setting out a formal conception of moral standing as relational, scalar, and unilateral, I consider whether and how an appeal to dependencies might be the basis for an animal's moral standing. If dependencies generate reasons for extending direct moral consideration, such reasons will admit of significant variations in scope and stringency. Cohen is in philosophy, Georgia state University.

Eight estimates of human carrying capacity. Carrying capacity in an ecological age and applied ecology. Human choices; the distribution of material well-being. Water. Natural constraints and time. How to slow human population growth. Cohen is in the Laboratory of Populations, Rockefeller University. (v9,#2)

Cohen, Joel E., *How Many People Can the Earth Support?* New York: Norton, 1995. 532 pages. Past human population growth. Four evolutions in population growth. The uniqueness of the present relative to the past. Future human population growth. Projection methods. Scenarios of future population. The

human carrying capacity of the earth. Eight estimates. A survey of four centuries. Human choices. Water. Natural constraints and time. (v9,#1)

Cohen, Joel E. "Population Growth and Earth's Human Carrying Capacity." *Science* 269(1995):341-345. Earth's capacity to support people is determined both by natural constraints and by human choices concerning economics, environment, culture (including values and politics), and demography. Human carrying capacity is therefore dynamic and uncertain. Human choice is not captured by ecological notions of carrying capacity that are appropriate for nonhuman populations. Simple mathematical models of the relation between human population growth and human carrying capacity can account for faster-than-exponential population growth followed by a slowing population growth rate, as observed in recent human history. Estimates of how many people Earth can carry have varied widely, from 1 to 100 billion, and estimates published in 1994 alone varied from 3 to 44 billion. The human population may be entering a zone where limits on the human carrying capacity of Earth will be encountered. The statement that "every human being represents hands to work, and not just another mouth to feed" does not specify the cultural, environmental, and economic resources available to make additional hands productive and therefore does not specify by how much the additional hands can increase or decrease human carrying capacity. An excellent, compact, summary article that everyone concerned with population growth ought to read. Cohen is in the Laboratory of Populations, Rockefeller University. (v6,#3)

Cohen, John, "Center Puts Hold on Mangabey Experiments," *Science* 314(3 November, 2006):743-744. Yerkes National Primate Research Center in Atlanta has temporarily withdrawn a request to conduct experiments on sooty mangabey monkeys that could unravel the biochemistry by which HIV causes AIDS. The U.S. Fish and Wildlife Service considers the sooty mangabey an endangered species. SIV, similar to HIV, naturally infects the mangabeys but rarely causes harm. Yerkes has 200 mangabeys and wished to use up to 20 animals for invasive surgery research, requiring eventually killing them. They do routinely draw blood from mangabeys for research. They also still hope to do the research.

Cohen, Jon, "Researchers Urged Not to Inject Virulent HIV Strain into Chimps," *Science* 283(1999):1090-1091. Previous HIV injections produce infections but do not make the chimps sick; newer strains do, and provide (some say) more realistic models of the human disease. A coalition of prominent AIDS researchers and primatologists (including Jane Goodall) have urged researchers not to use such strains "from both a scientific and an ethical standpoint." One researcher says, "The prospect of causing a rapidly progressive and fatal disease in this near-human species is abhorrent." With text of the letter of protest, p. 1117. (v.10,#1)

Cohen, Jon. "NIH to End Chimp Breeding for Research." *Science* Vol. 316, no. 5829 (1 June 2007): 1265. The NIH will end chimp breeding for research, claiming care for the 650 animals is too expensive. There had already been a moratorium on such breeding. Animal welfare groups welcome the decision, even while NIH officials deny that they made the decision on ethical grounds. Many researchers decry the decision, claiming that much benefit to human medicine can yet be gained from chimp research. This captive population will die out, although private facilities also have about 500 chimps.

Cohen, Jon. "The Endangered Lab Chimp." *Science* Vol. 315, no. 5811(26 January 2007): 450-52. A decline in the number of chimpanzees available for biomedical research in the U.S. has sparked a growing debate on the opportunities and costs of studies with our closest relatives. Most primate researchers now consider invasive experiments with chimps unethical, in most circumstances. But medical researchers reply that, nevertheless, primate research has led to enormously valuable medical advances in the past and may well do so in the future. It may also be unethical to forego such research.

Cohen, Jon. "NIH to End Chimp Breeding for Research." *Science* Vol. 316, no. 5829 (1 June 2007): 1265. The US National Institutes of Health (NIH), the world's largest funder of chimpanzees used in

biomedical research, has announced that it will phase out such research.

Cohen, Maurie J. "Science and Society in Historical Perspective: Implications for Social Theories of Risk MAURIE." Environmental Values 8(1999):153-176. ABSTRACT: Over the past decade risk society theory has become increasingly prominent within the field of environmental social theory. This perspective contends that conventional political divisions based on class are becoming less salient and are giving way to a politics predicated upon the distribution of risk. There is much in risk society theory, especially its central contention that public anxieties about high consequence-low probability events undermine the legitimacy of science, that has a distinctly German stamp. Through a comparative analysis of how national context has differently shaped science as a public epistemology this paper suggests we should tread carefully in moving to accept the general applicability of this theoretical approach. Colborn, Theo, Dianne Dumanoski, and John Peterson Myers, Our Stolen Future. New York; Dutton, Penguin Books, 1996. Claims there is a large and growing body of scientific evidence linking synthetic

chemicals in the environment to aberrant sexual development and behavioral and reproductive problems. Much of the evidence studies animals and ecological effects, but there are important implications for human health as well. Leading medical journals point ominously to hormone-disrupting chemicals' effect on human health and fertility. There are low sperm counts, infertility, genital deformities, hormonally triggered cancers of the breast and prostate gland, and neurological disorders in children, such as hyperactivity and deficits in attention, also developmental and reproductive problems in wildlife. The National Academy of Sciences has established an expert panel to assess the threats. With a forward by Vice-President Al Gore. Colborn is a scientist with the World Wildlife Fund; Dumanoski a journalist with the Boston Globe; Myers directs a foundation on global environmental protection and was formerly a zoologist with the National Audubon Society. Cole-King, Adam, "Costal and Marine Conservation in Britain: Ecology and Aesthetics, Land and Sea".

Environmental Values 3(1994):139-153. The long standing division of official responsibility in Britain, between the scientific and aesthetic aspects of environmental conservation has obscured more fundamental distinctions within conservation, such as its many different objectives and ethical bases. Public administration of conservation in Britain has recently been reorganized, but the question of the administrative status of the coast and sea has yet to be properly addressed. Consideration of the diverse needs of environmental conservation shows that traditional perceptions of the coast need to be radically reappraised. KEYWORDS: Conservation, environmental perception, coasts natural heritage, seascape. Cole-King is in maritime studies and international transport at the University of Wales, Cardiff. (EV)

ColeKing, Adam (Cole-King), "Marine Conservation: A New Policy Area," Marine Policy 17 (no. 3, May, 1993):171-185. The ethical bases for marine conservation, as well as background perceptions of the marine environment, as this affects policies, institutions, and implementation. There is no clear ethical or philosophical basis to guide marine conservation. The principal points of contention in environmental ethics are whether the duty to protect the environment is because it is intrinsically valuable or because it provides for human needs. If ecocentrism and enlightened self-interest require the same practical results, the ethical debate is of academic interest only. If not, it is extremely important. The chances are that it is extremely important, since it seems unlikely, based on past performance, that collective self-interest can ever be sufficiently enlightened to preserve all our future environmental options. Cole-King is in the Department of Maritime Studies and International Transport, University of Wales, Cardiff. (v5,#4)

Coleman, Earle J. "Is Nature Ever Unaesthetic?" Between the Species 5:138-146. Examines four models of aesthetic appreciation of nature: the contextual-ecosystem model, Kant's phenomenological model, Bosanquet's expressionist model, building to argue for a metaphysical model that provides a more inclusive account of aesthetic experiences of nature. Coleman is in the department of religion and philosophy at Virginia Commonwealth University, Richmond. (v1,#1)

Coleman, Earle J., "Is Nature Ever Unaesthetic?" Between the Species 5 (1989): 138-146. An examination of four models of aesthetic appreciation, all supplying negative answers to the title question. (Katz, Bibl # 2)

Coleman, Jon T., Vicious: Wolves and Men in America. New Haven: Yale University Press, 2005. A historian chronicles three centuries of Europeans interacting with wolves, finding the European view massively a social construction, and also more revealing of a "vicious" dimension in humans than in wolves. Europeans arrived with a millennia long mythological wolf lore, "the big bad wolf," and projected this mythology onto America wolves, which they exterminated as a menacing evil. But they did so with sadistic passion, with "wolf bullets" or meat hooks to ensure slow, tortuous deaths. When they captured wolves alive, they dragged them behind horses, set them on fire, or released them with their mouths and genitals wired shut. Death was not enough; the Europeans insisted on torture. Coleman interprets this as Europeans believing that to conquer a savage wilderness, one must act savagely. So they were licensed and required to act with enthusiastic cruelty. "People are vicious to the core ... Wolf killing confirms people's knack for generating pain and suffering." Meanwhile, of course, these vicious people have restored the wolf to parts of the landscape and repented of their past. Coleman is a University of Notre Dame historian.

Collins-Chobanian, Shari. "Beyond Sax and Welfare Interests: A Case for Environmental Rights." Environmental Ethics 22(2000):149-168. In "The Search for Environmental Rights," Joseph Sax argues that each individual should have, as a right, freedom from environmental hazards and access to environmental benefits, but he makes clear that environmental rights do not exist and their recognition would truly be a novel step. Sax states that environmental rights are different from existing human rights and argues that the closest analogy is welfare interests. In arguing for environmental rights, I follow Sax's direction and draw from the work of those who are the most relevant in establishing environmental rights. I consider Joel Feinberg's notion of welfare interests, Henry Shue's notion of basic rights, and James Nickel's right to a safe environment. I draw from Mill's harm principle, the superfund legislation, and the Clean Air Act to illustrate the existing ethical and legal bases for establishing environmental rights. Finally, I discuss positive and negative duties that such rights might carry. (EE)

Collins, Denis and Barkdull, John. "Capitalism, Environmentalism, and Mediating Structures: From Adam Smith to Stakeholder Panels." Environmental Ethics 17(1995):227-244. How can an environmental

ethic be developed that encompasses the concerns of both free market proponents and environmentalists? In this article we approach the environment-market debate using Adam Smith's writings in *The Theory of Moral Sentiments*, *The Wealth of Nations*, and *Lectures on Jurisprudence*. Smith's guiding principle for solving prominent conflicts of self-interest is that government intervention is required when the economic activities of some cause harm to others. The solution that follows from Smith's analysis is a government-funded, independent, democratically controlled, and democratically accountable mediating structure that derives impartial decisions and is authorized to impose its just and fair decisions on affected parties. In practical terms, this analysis provides the ethical foundation for the wide-ranging development of stakeholder panels composed of public interest group representatives and business representatives and empowered to develop solutions to public conflicts arising out of environmental problems. Collins is at the School of Business, University of Wisconsin-Madison. Barkdull is in the department of political science, Texas Tech University, Lubbock. (EE)

Collins, Joseph, Lear, John. "Free Market Miracle or Myth? Chile's Neo-Liberal Experiment", *The Ecologist* (1979) 26(no. 4,1996):156. Chile has been hailed as shining example of the successful application of free market policies. Since the 1970s, the public sector has been privatized, price controls lifted, government spending slashed and markets liberalized. Social and economic realities in Chile, however, are at odds with the rhetoric of the free marketeers. Income disparities between rich and poor have become worsen; the country's health care and welfare system has been dismantled; and control over Chile's natural resources has been concentrated in the hands of wealthy national and foreign interests, to the detriment of the environment.

Colwell, Tom, "The Ecological Perspective in John Dewey's Philosophy of Education." Educational Theory 35, no. 3 (Summer 1985): 255-265. Dewey has often been thought of as an anthropocentric social thinker; indeed his pragmatic instrumentalism is cited as an antithesis of an environmental perspective. Colwell argues that a proper understanding of Dewey's sense of organism-environment interaction suggests just the opposite conclusion. "Dewey's position is a unitary conception of nature which includes both ... the human community and the nonhuman biophysical environment" (p. 256). Dewey's naturalism tends to eliminate the old dualism of man and nature, performing a Copernican Revolution that places man firmly in nature. Indeed, for Colwell, Dewey's theory of education is itself ecological: "Education consists of those special human organism-environment interactions that are conducive to an expanding awareness of the situationally related organism-environment conditions that promote growth" (p. 265). (Katz, Bibl # 1)

Colwell, Tom, "The Ethics of Being Part of Nature" Environmental Ethics 9(1987):99-113. Colwell suggests that environmental philosophers rarely take seriously their claim that man is part of nature. Once understood, this idea ends the duality between man and nature, and renders these concepts obsolete. The search for intrinsic value in nature is just another example of this outmoded dualistic thinking. "All values are instrumental. The important intellectual and moral question is which instrumental value is best suited to promoting the activity of environment complexes in ways that are responsive to the life requirements of all its members" (p. 109). (Katz, Bibl # 1)

Colwell, Tom. "The Ethics of Being Part of Nature." Environmental Ethics 9(1987):99-113. Most environmental philosophers acknowledge that humans are part of nature; yet few have grasped the significance of the idea fully, and as a result it remains ambiguous. I argue that when taken to include humans and their culture, the idea supports philosophical naturalism as an alternative to dualism and provides a new approach to environmental ethics capable of meeting popular objections to naturalism in ethics. Naturalism, I conclude, requires a new way of thinking about nature, and by implication greater care in the choice of language used to talk about nature. Colwell is in the department of Cultural Foundation, New York University, NY, NY. (EE)

Committee on Protection and Management of Pacific Northwest Anadromous Salmomids, National Research Council. Upstream: Salmon and Society in the Pacific Northwest. Washington, D.C.: National Academy Press, 1996. 472pp. \$44.95. A wealth of informative graphs and charts and historical perspective to clarify a contemporary issue. Salmon biology and geography; the impacts of human

activities; values, attitudes, and conflicting desires for short-term economic gain and long-term environmental health; and the impact of hatcheries.

Committee on Characterization of Wetlands, National Research Council. Wetlands: Characteristics and Boundaries. Washington, D.C.: National Academy Press, 1995. 328pp. \$37.95. How to define wetlands; a rational, scientific basis for delineating wetlands in the landscape; and recommendations for further action. The book also discusses the diverse and beneficial hydrological and ecological functions of wetlands and examines the controversial no-net-loss policy.

Committee on Scientific Issues in the Endangered Species Act, National Research Council. Science and the Endangered Species Act. Washington, D.C.: National Academy Press, 1995. 288pp. \$39.95. This book analyzes concepts of species and how they have been interpreted for purposes of the ESA, examines conflicts between species when individual species are identified for protection, and assesses extinction risk and decisions under the ESA. It concludes with a look beyond the Endangered Species Act and suggests additional means of biological conservation and ways to reduce conflicts. (v8,#1)

Committee on Environmental Issues in Pacific Northwest Forest Management, National Research Council. Forests of the Pacific Northwest. Washington, D.C.: National Academy Press, 1997. 350pp. \$44.95. Explores the markup role of Pacific Northwest wood products and looks at the implications if other regions should be expected to make up for reduced timber harvests. The book reviews the health of the forested ecosystems of the region, evaluating the effects of past forest use patterns and management practice. It also discusses the biological importance, social significance, and management of old-growth as well as late-succession forests.

Common, M.S., R.K. Blamey and T.W. Norton, "Sustainability and Environmental Valuation." Environmental Values Vol.2 No.4(1993):299-334. ABSTRACT: For economists, sustainability and environmental valuation are connected in two ways. At the micro level, proper environmental valuation is required if projects are to be approved and rejected consistently with sustainability requirements. This is cost-benefit analysis. At the macro level, many take the view that sustainability requires that national income measurement be modified so as to account for environmental damage. Such natural resource accounting is possible only if environmental damage is valued for incorporation into the economic accounts. The paper reviews the techniques that economists have developed for environmental valuation. In regard to cost-benefit analysis and sustainability, it is noted that the technique on which most interest focuses, the Contingent Valuation Method, involves the extension of the domain of consumer demand analysis to include the natural environment. Contributions questioning the appropriateness of this are reviewed, and it is argued that they merit more attention from economists than they have received to date. In regard to natural resource accounting, it is argued that while there is little prospect of it achieving what its proponents claim for it, the modelling that it necessarily implies has the potential both to clarify valuation issues and play an important role in informing the policy process. KEYWORDS: Sustainability, valuation, environment, contingent valuation, natural resource accounting, optimization. Centre for Resource and Environmental Studies, Australian National University, Canberra, ACT 0200, Australia.

Compson, Jane F., Whose Pain, Which Morality? A Defense of the Moral Considerability of Animals Using a Coherence Model of Ethical Justification. M.A. Thesis, Colorado State University, 2005. In a search for a sound theoretical justification for the equal consideration of animals, moral realism and foundationalism are rejected as implausible. First general accounts to raise the moral status of animals (such as those of Peter Singer and Tom Regan) are beset by related difficulties. The coherence approach, demonstrated by second generation ethicists (such as Bernard Rollin and David DeGrazia) is defended. The epistemological differences between the realist and the coherence approach are exemplified with a discussion on value; the coherence approach is more plausible, though it does have to be defended against relativism. The coherence approach is applied to the counter-intuitive arguments of Peter Carruthers, showing that the coherence approach does not lead to a relativist free-for-all, but provides firm evaluative criteria for making moral judgments without having to postulate objective, mind-independent truths. Compson is in philosophy at the University of Central Florida, Orlando.

Comstock, Gary L., "Is it Unnatural to Genetically Engineer Plants?" Weed Science 46(1998):647-651. Eight arguments against genetic engineering of plants are considered. For example: To engage in plant engineering is to play God. But the argument fails because, if so, playing God is not always a bad thing. For example: To engage in plant engineering is illegitimately to cross species boundaries. But species are regularly transmogrifying themselves to produce new species. For example: To engage in plant engineering is unnatural because it disrupts the integrity, beauty, and balance of creation. This objection has much to commend it, but it is not an intrinsic objection. Plant engineering might have such consequences, but it need not. In sum, those opposed to genetic engineering of plants will have a hard time finding justification for their case in the unnaturalness objection, and they may best help to advance the conversation by focusing instead on consequences. Comstock, Gary L. "Do Agriculturalists Need a New, an Ecocentric, Ethic?" Agriculture and Human Values 12 (Winter 1995): 2-16. In 1973, Richard Sylvan began his seminal essay, "Do We Need a New, an Environmental Ethic?" with these words: "It is increasingly said that...Western civilization...stands in need of a new ethic...setting out people's relations to the natural environment." In the intervening years, it has increasingly been said that Western civilization is in need of ecocentrism, an ethic according to which a thing's value is derived from its contribution to the integrity, stability, and beauty of ecosystems. Comstock argues that ecocentrism is an inadequate ethic for agriculturalists, and suggests they look instead to "extensionists," or animal rights philosophers, for guidance regarding our relations to the natural environment. Comstock is Associate Professor of Religious Studies at Iowa State U. and Head of the ISU Bioethics Program. The article is an expanded version of his 1994 presidential address to the Agriculture, Food, and Human Values Society. (v6,#3)

Comstock, Gary L., "Theism and Environmental Ethics." In Quinn, Philip L. and Charles Taliaferro, eds., A Companion to Philosophy of Religion, pp. 505-513. Cambridge, MA: Blackwell Publishers, 1997. Theistic metaphysical beliefs that construe God as enemy, owner, and redeemer of nature seem to incline more to an anthropocentric environmental ethic while those that see God as nature's husband, embodiment, or identity seem to lean more to ecocentrism. However, there seems to be little in the way of necessary or logical entailment between one's view of God and one's environmental ethics. The psychological dependence may run in exactly the opposite direction; our intuitions about the environment may do more to shape our views of God than our intuitions about God do to shape our attitudes to nature. Conn, P. Michael, and Parker, James, "Animal Rights: Reaching the Public," Science 282(20 November 1998):1417. The lead editorial in this issue of Science. "A misguided cause ... now seeks to end biomedical research because of the theory that animals have rights precluding their use in research. Scientists need to respond forcefully to animal rights advocates, whose arguments are confusing the public and thereby threatening advances in health knowledge and care. There is little logic in emotional

campaigns to end the practice of animal experimentation. A 1990 study found that although 63% of animal rights literature concerns the use of animals in science, such use each year involves 0.003 percent of the number of animals consumed for food. Only half as many animals undergo medical procedures in research as endure surgery ordered by pet owners for cosmetic reasons..."

"Scientists must communicate their message to the public in a compassionate, understandable way--in human terms, not the language of molecular biology. We need to make clear the connection between animal research and a grandmother's hip replacement, a father's bypass operation, a baby's vaccination, and even a pet's shots. ... If good people do nothing, there is a real possibility that an uninformed citizenry will extinguish the precious embers of medical progress." Convention on Biological Diversity, in PDF files and website: <<http://www.biodiv.org/>>

Convened after the 1992 Earth Summit in Rio de Janeiro, the Convention on Biological Diversity has three primary goals: the conservation of biological diversity, the sustainable use of its components, and the fair and equitable sharing of the benefits from the use of genetic resources. The main body of the organization's home page is dedicated to disseminating information about upcoming meetings, news, and events, such as the expert meeting on the global strategy for plant conservation and the various constituent groups that make up the Convention. The number of online documents available here is quite prodigious, and is divided into groups that include quarterly reports, global biodiversity outlook reports, and case-study documents. Users may elect to browse through these collections, or choose to use the search engine. On the left-hand side of the site's homepage, visitors can peruse the numerous sections devoted to the convention bodies (along with information about their current status and respective missions), information services provided by the Convention, and a well-developed area on biosafety protocol. (v.14, #4)

Convey, Peter, and Mark I. Stevens. "Antarctic Biodiversity." *Science* Vol. 317, no. 5846 (28 September 2007): 1877-78. The terrestrial and freshwater ecosystems in the 0.3% of Antarctica that is free of ice contain small invertebrates, lower plants, and microbes. These were long thought to have been depleted in glacial ice ages and recolonized in warmer periods. But recent evidence suggests that forms of animal and plant life there have also survived glacial cycles over millions of years and have ancient origins.

Conviser, Richard. "Toward Agricultures of Context." Environmental Ethics 6(1984):71-85. The current mode of agricultural organization produces both political and ecological problems. I explore several deeply-rooted cultural origins of that mode of organization, particularly the movements toward scientism and capitalism; each of these is shown to emphasize abstraction from context. A contrasting set of values, emphasizing holism and localism, is then examined. Several forms of agriculture consistent with these contrasting values, and exempt from previously discussed problems, are described. Conviser is at the Science and Technology Studies Division, Rensselaer Polytechnic Institute, Troy, NY. (EE)

Cook, Julie. "The Philosophical Colonization of Ecofeminism." Environmental Ethics 20(1998):227-46. There is general agreement among ecofeminists regarding the desirability of a variety of expressions of ecofeminism, but this pluralism is under threat with the emergence of an approach that emphasizes the primacy of a philosophical ecofeminism which claims the authority to prescribe what ecofeminism should be. The recent anthology Ecological Feminism (Karen J. Warren, ed.) is symptomatic of this trend, with contributors who affirm the philosophical significance of ecological feminism by privileging philosophers' voices over those of other ecofeminists, rather than by engaging in critical dialogue with,

and exploring connections between, different ecofeminist discourses. This colonizing strategy actively excludes many women's voices from the creation of an environmental ethic, including those of activist, spiritual, and "Third World" ecofeminists, but fails to offer any adequate philosophical grounds for doing so. Cooke, S. J. and Cowx, I. G., "The Role of Recreational Fishing in Global Fish Crises," BioScience 54(no. 9, 2004): 857-859(3). Exploitation of fishery resources has become a major conservation issue on a global scale. Commercial fisheries have been repeatedly blamed for the worldwide declines in fish populations. However, we contend that the recreational fishing sector also has the potential to negatively affect fish and fisheries. Here we present evidence to show that both recreational and commercial fishing sectors deserve consideration as contributors to the exploitation of fish in marine and inland waters. The lack of global monitoring and compiling of statistics on recreational fishing participation, harvest, and catch and release has retarded our ability to understand the magnitude of this fishing sector. Using data from Canada, we estimate that the potential contribution of recreational fish harvest around the world may represent approximately 12 percent of the global fish harvest. Failure to recognize the potential contribution of recreational fishing to fishery declines, environmental degradation, and ecosystem alterations places ecologically and economically important resources at risk. Elevating recreational fishing to a global conservation concern would facilitate the development of strategies to increase the sustainability of this activity. (v.14, #4)

Cooke, Steven J; Cowx, Ian G, "The Role of Recreational Fishing in Global Fish Crises", BioScience 54(no.9, 1 September 2004):857-859(3). Exploitation of fishery resources has become a major conservation issue on a global scale. Commercial fisheries have been repeatedly blamed for the worldwide declines in fish populations. However, we contend that the recreational fishing sector also has the potential to negatively affect fish and fisheries. Here we present evidence to show that both recreational and commercial fishing sectors deserve consideration as contributors to the exploitation of fish in marine and inland waters. The lack of global monitoring and compiling of statistics on recreational fishing participation, harvest, and catch-and-release has retarded our ability to understand the magnitude of this fishing sector. Using data from Canada, we estimate that the potential contribution of recreational fish harvest around the world may represent approximately 12 percent of the global fish harvest. Failure to recognize the potential contribution of recreational fishing to fishery declines, environmental degradation, and ecosystem alterations places ecologically and economically important resources at risk. Elevating recreational fishing to a global conservation concern would facilitate the development of strategies to increase the sustainability of this activity.

Cooke, Steven; Suski, Cory, "Do we need species-specific guidelines for catch-and-release recreational angling to effectively conserve diverse fishery resources?," Biodiversity and Conservation 14(no.5, May 2005):1195-1209(15).

Cookson, Richard, "Welfare Economic Dogmas: A Reply to Sagoff," Environmental Values 5(1996):59-74. This article examines Sagoff's criticisms of Four Dogmas of Environmental Economics (Environmental Values, Winter 1994) and argues that none of them are fatal. Many of the criticisms appear to rest on general misunderstandings about welfare economics. One misunderstanding is that transaction costs are theoretically indistinguishable from regular production costs. The theoretical distinction is that transaction costs vary under alternative policies and institutions whereas production costs are fixed by tastes, technology and endowments. Another misunderstanding is that market failure concerns only Pareto efficiency. Market failure also concerns social efficiency with respect to the social welfare function, a device for making explicit ethical judgments about the interpersonal distribution of welfare. A third misunderstanding is that the rationality assumption drives economic theory. In fact, the explanatory power of economic models comes mainly from explicit assumptions about the constraints facing economic agents. A fourth misunderstanding is that welfare economics is used as a mechanism for making legal and political decisions. Rather, welfare economics is used as a method for informing legal and political decisions by evaluating their outcomes on the basis of individual welfare. Used properly, it can improve the democratic process by bringing hidden costs and difficult issues to the attention of both policy-makers and the wider public. KEYWORDS: Coase theorem, efficiency, transaction costs, utility, welfare economics (EV)

Cooley, D. R., with G .A. Goreham, "Are Transgenic Organisms Unnatural?," Ethics and the Environment 9(no. 1, 2004):46-55. The introduction of transgenic organisms into agriculture has raised a firestorm of controversy. Many view the technology as a pathway to a much better future society, whereas others condemn it for endangering people and the environment. One defective argument against transgenics is the "Unnatural-Is-Unethical" argument (UIU). UIU attempts to prove if transgenic organisms are unnatural and all unnatural things are morally bad, then transgenics are morally bad. However, the argument fails once it is shown that there is no plausible definition for "unnatural." Therefore, UIU should be abandoned in favor of arguments more likely to succeed. Cooley is in ethics in the Department of History and Religion, North Dakota State University. Goreham is in sociology, North Dakota State University. (E&E)

Cooley, D. R., Gary Goreham, and George A. Youngs, Jr., "Practical Moral Codes in the Transgenic Organism Debate," Journal of Agricultural and Environmental Ethics 17(2004):517-544. In one study funded by the United States Department of Agriculture, people from North Dakota were interviewed to discover which moral principles they use in evaluating the morality of transgenic organisms and their introduction into markets. It was found that although the moral codes the human subjects employed were very similar, their views on transgenics were vastly different. In this paper, the codes that were used by the respondents are developed, compared to that of the academically composed Belmont Report, and then modified to create the more practical Common Moral Code. At the end, it is shown that the Common Moral Code has inherent inconsistency flaws that might be resolvable, but would require extensive work on the definition of terms and principles. However, the effort is worthwhile, especially if it results in a common moral code that all those involved in the debate are willing to use in negotiating a resolution to their differences. Keywords: Belmont report, GMO, moral code, moral principle, practical morality, transgenic organisms. The authors are in the Department of History and Religion, North Dakota State University, Fargo, ND. (JAEE)

Cooper, David E., "Human Sentiment and the Future of Wildlife." Environmental Values Vol.2 No.4(1993):335-346. ABSTRACT: Identifying what is wrong with the demise of wildlife requires prior identification of the human sentiment which is offended by that demise. Attempts to understand this in terms of animal rights (individual or species) and the benefits of wildlife to human beings or the wider environment are rejected. A diagnosis of this sentiment is attempted in terms of our increasing admiration, in the conditions of modernity and postmodernity, for the 'harmony' or 'at homeness' of wild animals with their environments. The diagnosis is defended against certain misunderstandings, and implications are tentatively drawn from it for environmental education and the management of wildlife. KEYWORDS: Animal ethics, animal rights, environmental education, moral sentiment, species, wildlife. Department of Philosophy, University of Durham, Durham DH1 3HN, UK.

Cooper, David E., and Simon P. James, Buddhism, Virtue and the Environment. Ashgate, 2005. Buddhism, one increasingly hears, is an 'eco friendly' religion. It is often said that this is because it promotes an 'ecological' view of things, one stressing the essential unity of human beings and the natural

world. While agreeing that Buddhism is, in many important respects, in tune with environmental concerns, Cooper and James argue that what makes it 'green' is its view of human life. The true connection between the religion and environmental thought is to be found in Buddhist accounts of the virtues - those traits, such as compassion, equanimity and humility, that characterise the life of a spiritually enlightened individual. Central chapters of this book examine these virtues and their implications for environmental attitudes and practice. Buddhism. The authors are at the University of Durham, UK.

Cooper, David and Simon James. Buddhism, Virtue and the Environment (Ashgate, 2004). Buddhism, one increasingly hears, is an 'eco-friendly' religion. It is often said that this is because it promotes an 'ecological' view of things, one stressing the essential unity of human beings and the natural world. This book presents a different view. While agreeing that Buddhism is, in many important respects, in tune with environmental concerns, Cooper and James argue that what makes it 'green' is its view of human life. The true connection between the religion and environmental thought is to be found in Buddhist accounts of the virtues - those traits, such as compassion, equanimity and humility, that characterise the life of a spiritually enlightened individual. Central chapters of this book examine these virtues and their implications for environmental attitudes and practice. Buddhism, Virtue and Environment will be of interest not only to students and teachers of Buddhism and environmental ethics, but to those more generally engaged with moral philosophy. Written in a clear and accessible style, this book presents an original conception of Buddhist environmental thought. The authors also contribute to the wider debate on the place of ethics in Buddhist teachings and practices, and to debates within 'virtue ethics' on the relations between human well-being and environmental concern. Available from Ashgate Publishing in hardback (£50.00, ISBN:0 7546 3909 6) and paperback (£16.99, ISBN: 0 7546 3910 X).

Cooper, David E., "Heidegger on Nature," Environmental Values 14(2005):339-351. The primary purpose of the paper is the broadly exegetical one of explaining and connecting Heidegger's many remarks, made in several different contexts of enquiry, on nature. The three main contexts are those of ontology, scientific methodology, and technology. After showing how Heidegger's central theses in these contexts are related to one another, I argue, in the final section, that his observations on scientific method are pivotal. Unless these are secured, his further claims about ontology and technology lose their essential support. Cooper is in philosophy, University of Durham, UK. (EV)

Cooper, David E. *A Philosophy of Gardens*. Oxford: Oxford University Press, 2006. Cooper explores the issue of why gardens are significant and mean so much to people. He argues that garden appreciation is distinct from the appreciation of art and the appreciation of nature, and that gardens matter as an epiphany of an intimate co-dependence between creative human activity and the mystery that allows for there to be a world for humans. He also argues that environmental philosophy should not focus on wilderness to the exclusion of the humanly shaped environment that includes gardens, and we should recognize how much gardens contribute to the good life for people.

Cooper, Gregory J., The Science of the Struggle for Existence: On the Foundations of Ecology. Cambridge, UK: Cambridge University Press, 2003. Ecology is interpreted as the science of the struggle for existence, linking it with evolutionary biology. Cooper puzzles about the differences, if any, between ecology and evolutionary biology. He also analyzes the tension between law-like explanations, such as characterize physics and chemistry, and the more historical character of both ecology and evolutionary biology, involving openness and unpredictability. Perhaps ecology is a piecemeal science. This also requires analysis of such ideas as stability, equilibrium, succession, and so forth. A better term than law is "nomic force" which "comes in degrees and is restricted to particular domains" (p. 123, p. 115, p. 181).

"Theoretical explanation does not need laws in the traditional sense, only ... highly resilient generalizations" (p. 194). Cooper brings a sophisticated awareness of issues in the philosophy of science to bear on analysis of the tensions that have characterized ecology over the last century. Cooper is in philosophy and ethics at Washington and Lee University, Lexington, Va.

Cooper, Gregory, "Teleology and Environmental Ethics," American Philosophical Quarterly 35 (no. 2, 1998):195-207. There is a disturbing tendency in the environmental ethics literature to rely on metaphysically rich, but scientifically controversial, ideas from the sciences of ecology and ethology. Three examples are discussed; one from the animal rights camp, a second from the reverence for life perspective, and a third from the ethical holists. In each of these cases, value theory helps itself to a kind of teleology that it is not clear the science is ready to yield. Cooper is at Washington and Lee University, Lexington, VA. (v.13,#2)

Cooper, Gregory, "Generalizations in Ecology: A Philosophical Taxonomy," Biology and Philosophy 13(1998):555-586. There has been uncertainty and controversy over general knowledge in ecology. Perhaps only case by case knowledge is available, no genuine nomothetic knowledge. Philosophers of biology wonder if there are laws anywhere in biology. Cooper provides a framework for such general knowledge claims, with three broad categories--phenomenological, causal, and theoretical. While there are probably no laws as that term is generally understood in philosophy of science, it does not follow that everything in ecology is equally contingent. One can recognize degrees of contingency. This has implications for setting environmental policy based on ecological knowledge. Cooper is in philosophy at Duke University. (v.9,#4)

Cooper, N. S. "Wildlife Conservation in Churchyards: A Case-study in Ethical Judgements," Biodiversity and Conservation 4(no.8, Nov. 1995):916- . (v6,#4)

Cooper, Nigel S., "Wildlife Conservation in Churchyards: A Case-Study in Ethical Judgments," Biodiversity and Conservation 4(1995):916-928. Groups promoting wildlife in churchyards, or other sites, discover that they face normative questions that have no scientific answers. The language of management is used for handling these questions, but this metaphor has unhelpful associations with predetermined goals, a culture of control and self-centeredness. Using a case-study approach, conflicts between conserving natural entities or natural processes (e.g. transplanting scarce plants); between caring for the individual organism or for the system (e.g. felling trees); and between conserving the natural or the cultural heritage (e.g. repointing walls) are examined. These case of conflicts of duty illustrate the value of attention to circumstances, proportionality, and compromise. The social mechanisms of moral debate include legal protection and the power of stories to give meaning and vision. Ethics is a communal activity. By listening to others and attending to nature our sensibilities will become more refined and our ethical judgments will develop. Cooper is a pastor in Rivenhall, Witham, Essex, UK. (v7,#2)

Cooper, Nigel S. "How Natural is a Nature Reserve? An Ideological Study of British Nature Conservation Landscapes," Biodiversity and Conservation 9(no. 8, 2000):1131-1152. Abstract. Areas set apart for nature conservation in Britain are broadly categorised according to their cultural purpose, and names are assigned to these in this paper. Nature reserves may be similar to zoos and botanic gardens in aiming to maintain the diversity of species and if so are termed "biodiversity reserves". This tradition understands nature as a static collection of entities apart from humans. Maintaining traditional management at a site is arguably a good way to sustain species; it also retains old ways in which humans and nature were integrated in the life of the nation and so are called "historic countryside parks". There is growing interest in "wilderness areas", where nature is seen as primarily processes protected from human interference. Despite the strength of each of these, they suffer from attempting to restrict nature to a ghetto, a process that is economically and environmentally costly. "Companion places" are places which set sustainable examples of integrating human life and economic activity with maintaining biodiversity

and offering an opportunity to encounter wild processes at the heart of life. The language of these four types, or vectors, of nature reserves is offered to help the discussion of our place in nature. Key words: biodiversity, historic countryside, language, sustainability, wilderness.

Cooper, Nigel S., "Speaking and listening to nature: Ethics within ecology," Biology and Conservation 9(2000):1009-1027. Abstract. One context for the papers arising from INTEGOL VII in this special issue is the debate over the social construction of science. Some fear that advocates for the social or cultural construction of ecology will undermine attempts to defend nature. But resources are made available in a mediating position of social 'construal', particularly alerting ecologists to the social and ethical dimensions of the conducting of their work. When speaking, ecologists will use living and dead metaphors and these carry connotations which in turn raise ethical questions. Different political interest groups may use a word like biodiversity for different ethical purposes. The position of any one speaker is limited, and so greater knowledge is achieved if scientists listen to the situated knowledges of other, diverse people. Even Nature herself, or creatures, may have aspects of personhood. The good ecologist will listen with empathy as a naturalist to what is being said, giving Nature the respect she deserves. These are some of the ethical implications in the very doing of ecology. Key words: biodiversity, metaphor, personalism, situated knowledge, social construction of science. Cooper is in the Diocese of Chelmsford, and lives at The Rectory, Rivenhall, Witham, Essex. (v.13,#1)

Cordell, H. Ken, Carter J. Betz, and Gary T. Green. "Nature-based Outdoor Recreation Trends and Wilderness." *International Journal of Wilderness* Vol. 14, no. 2 (2008): 7-9, 13. Despite media attention to studies claiming that nature-based recreation is in decline, these authors find that this is true of only some forms of such recreation. "[M]any other activities seem to be continuing and some have even demonstrated rather strong popularity growth. One such activity is visiting wilderness and other primitive areas." How to interpret uneven data is a problem, but the authors conclude: "All in all, by taking a broad view of this 21st century, it appears to us that Americans' interest in and appreciation of nature-based recreation and wildlands is up." Cordell is a research scientist with the USDA Forest Service in Athens, Georgia.

Cordell, Ken, Tarrant, Michael A., and Green, Gary T., "Is the Public Viewpoint of Wilderness Shifting?" International Journal of Wilderness 9(no. 2, August 2003):27-32. Shifts since the mid 1990's in the values the public places on wilderness. Public views of the National Wilderness Preservation System were compared from national surveys conducted in 1994 and in 2000. Results show that while more people in 2000 were aware of the Wilderness System, this increase in awareness has not created greater support for additional wilderness acreage. But the levels of importance people place on ecosystem services, existence of wilderness, recreation, and future use options for existing protected wilderness have increased sharply since 1994. Overall, this seems to indicate a need for greater emphasis on nonuse values in setting policy and managing wilderness. Awareness and support for wilderness vary significantly among ethnic, age, and regional groups. It seems as though people do not want more wilderness but they value what they already have designated much more than before. The authors are with the USDA Forest Service and the School of Forestry, University of Georgia, Athens, GA. (v 14, #3)

the American governance system--its political philosophy, institutions, notions of citizenship, and politics, as well as its resource management practices--if the shift to ecosystem management is to be realized. (v.10,#1)

Corwin, Jennifer A. An Evaluation of Kant's Claims Regarding the Non- Rational Nature of Non-Human Animals, M.A. thesis, Colorado State University, fall 2002. It is generally accepted that Kant's ethical theories cannot serve as a basis for a non-anthropocentric environmental ethic because Kant asserts that non-human animals are not owed direct duties from human beings because non-human animals are not rational creatures. But Kant's conception of rational does not permit him to make such a "knowledge claim." At most Kant can only theorize or postulate the non- rationality of animals as a theoretical possibility and not a cognitive certainty. Lacking such knowledge, we can and ought to expand Kant's ethical theories to include direct duties toward non-humans, serving as a basis for a non-anthropocentric environmental ethic. The thesis advisor was Jane Kneller. (v.13,#4)

Costanza, Robert, and twelve others. "The Value of the World's Ecosystem Services and Natural Capital." Nature 387(15 May 1997):253-260. The services of ecological systems and the natural capital stocks that produce them are critical to the functioning of the Earth's life support system. They contribute to human welfare, both directly and indirectly, and therefore represent part of the total economic value of the planet. The authors have estimated the current economic value of 17 ecosystem services for 16 biomes, based on published studies and a few original calculations. For the entire biosphere, the value (most of which is outside the market) is estimated to be in the range of US\$ 16-54 trillion (10¹²) per year, with an average of US\$ 33 trillion per year. Because of the nature of the uncertainties, this must be considered a minimum estimate. Global gross national product total is around US\$ 18 trillion per year.

Costanza admits his group's numbers are "back-of-the-envelope" estimates, but says they are close enough to help set ecosystem usage taxes. Also in this issue is a commentary by Stuart L. Pimm, "The Value of Everything," Nature 387(15 May 1997):231-232. A summary is Wade Roush, "Putting a Price Tag on Nature's Bounty," Science 276(16 May 1997):1029. Some complain that the numbers are worthless; other say the study is important, no matter what the numbers, as they are relatively huge. Another study, by David Pimentel, came up with only \$ 3 trillion by comparison. (v8,#2)

Cothorn, C. R., ed., Handbook for Environmental Risk Decisionmaking. Boca Raton, FL: Lewis Publishers, 1996. (v7,#4)

Cothorn, C. Richard, ed., Handbook for Environmental Risk Decisionmaking. Boca Raton, FL: Lewis Publishers (CRC Press), 1995. 416 pp. \$69.95 The publisher's address is: 2000 Corporate Blvd., NW, Boca Raton, FL, 33431 USA; PH 800-272-7737; FAX 800-374-3401. Among the contributors to the volume are ethicists, decision makers, risk assessors, econonmists, scientists, philosophers, journalists, attorneys, theologians, policy makers, environmentalists, and regulators. Some contributors are: Richard Andrews, Scott Baker, Donald Brown, Thomas Burke, Bayard Catron, Victor Cohn, William Cooper, Douglas Crawford-Brown, William Freudenburg, Douglas MacLean, Hon. Mike McCormack, James Nash, Bryan Norton, Van Rensellear Potter, David Schnare, Virginia Sharpe, and Kristin Shrader-Frechette. The volume resulted from a one-day symposium held at the August 1994 annual meeting of the Environmental Division of the American Chemical Society. The symposium consisted of two keynote speakers and fourteen presentations, although the book has eight more papers to flesh out the topics.

The volume is organized as a supplemental textbook. Sections are: introduction, issues in environmental risk decision making, values and value judgements, commentary and summary.

The editor summarizes the argument of the book as follows: Values and ethics should be included in the environmental decision making process for three reasons; they are already a major component, although unacknowledged; ignoring them causes almost insurmountable difficulties in risk communication; and because it is the right thing to do. The existing models for environmental risk assessment do not contain any explicit mention of values, value judgements, ethics, or perceptions. However, these are often the main bases used in making such decisions. For example:

- alar was banned to protect children
- the linear, no-threshold dose-response curve and use of combined upper 95% confidence limits are based on safety, not science
- the idea of zero discharge is based on the sanctity of the individual
- forests and wetlands are preserved because of stewardship
- sustainable development is based on protecting future generations
- nuclear power is avoided because of fear of a catastrophe.

Courtenay Hall, Pamela Mae, *Ecoholism and its Critics: A Critical Exploration of Holism in Environmental Ethics and the Science of Ecology*, Ph. D. thesis in philosophy, University of Toronto, 1995. 409 pages. ISBN 0-612-07281-9. In the 1970's, Western philosophers such as John Rodman and Kenneth Goodpaster, began to explore the possibility that the individualist framework of modern moral philosophy might be part of the environmental problem. Intrigued by the science of ecology, they took seriously the possibility that the view of humankind as part of a more comprehensively understood nature might bring with it a new, holistic foundation for understanding what has moral significance, and why. This has expanded to include ecoholist themes in more recent work, including deep ecology and ecofeminism. I develop a topography of the types of "ecoholism" thought to support the belief that all of nature is morally significant. I critically assess their support in the science of ecology. Ecology is comprised of a diverse group of research programs none of which is a "holistic" science in the sense required to support ecoholism. In the light of feminist and other critiques of science, the project of seeking to base ethics on science is deeply problematic. The advisor was L. W. Sumner. (v.10,#1)

Cousins, Emily, "Mountains Made Alive: Native American Relationships with Sacred Land," *Cross Currents* 46 (no. 4, Winter 1996/97):497-509. "The phrase 'sacred land' is used frequently these days, both by Native Americans trying to protect land and by non-Natives sensitive to this cause. Yet despite its increased use, the meaning of the phrase remains elusive to many non-Natives, who relate to land mostly through property lines or hiking trails. Traditional Native American cultures, on the other hand, have defined geography through myth, ritual ceremonies, and spirit power. This difference highlights perhaps the widest gulf between the two cultures. It also represents a place where we must meet, as both cultures face environmental crisis." Cousins is a writer and editor living in Missoula, Montana. (v.8,#4)

Covich, Alan P et al., "The Role of Biodiversity in the Functioning of Freshwater and Marine Benthic Ecosystems", *BioScience* 54 (no. 8, 1 August 2004):767-775(9). Empirical studies investigating the role of species diversity in sustaining ecosystem processes have focused primarily on terrestrial plant and soil communities. Eighteen representative studies drawn from post-1999 literature specifically examined how changes in biodiversity affect benthic ecosystem processes. Results from these small-scale, low-diversity manipulative studies indicate that the effects of changes in biodiversity (mostly synonymous with local species richness) are highly variable over space and time and frequently depend on specific biological traits or functional roles of individual species. Future studies of freshwater and marine ecosystems will require the development of new experimental designs at larger spatial and temporal scales. Furthermore, to successfully integrate field and laboratory studies, the derivation of realistic models and appropriate experiments will require approaches different from those already used in terrestrial systems.

ethics: enlightened anthropocentrism, ecocentrism, and geocentrism. John Paul II never moves past an anthropocentric viewpoint. Cowdin suggests moving the tradition forward toward an evaluation of nature for its own sake and not simply for fulfillment of human needs. Cowdin teaches moral theology at the Catholic University of America. (v4,#4)

Cowell, Mark. "Ecological Restoration and Environmental Ethics." Environmental Ethics 15(1993):19-32. Restoration ecology has recently emerged as a branch of scientific ecology that challenges many of the traditional tenets of environmentalism. Because the restoration of ecosystems, "applied ecology," has the potential to advance theoretical understanding to such an extent that scientists can extensively manipulate the environment, it encourages increasingly active human participation within ecosystems and could inhibit the preservation of areas from human influences. Despite the environmentally dangerous possibilities that this form of science and technology present, restoration offers an attractive alternative for human interaction with the environment. I outline the primary claims that have been made for ecological restoration, examine inconsistencies with restorationists' philosophical position, and propose a reassessment of the definition of restoration that may aid in the clarification and development of a system of environmental ethics that recognizes human relationships with the environment as potentially symbiotic and positive. Cowell is in the department of Geography and Planning, Memphis State University, Memphis, TN. (EE)

Cox, Damian. "On the Value of Natural Relations." Environmental Ethics 19(1997):173-183. In "A Refutation of Environmental Ethics" Janna Thompson argues that by assigning intrinsic value to nonhuman elements of nature either our evaluations become (1) arbitrary, and therefore unjustified, or (2) impractical, or (3) justified and practical, but only by reflecting human interest, thus failing to be truly intrinsic to nonhuman nature. There are a number of possible responses to her argument, some of which have been made explicitly in reply to Thompson and others which are implicit in the literature. In this discussion I describe still another response, one which takes Thompson's concerns about value seriously, but does not assign nature intrinsic or nonanthropocentric value. I suggest a relational environmental ethic as the basis for a genuinely ethical stance toward nature in which our relations to nature are a principal object of ethical concern. Cox is in the School of Social and Cultural Studies, Edith Cowan University, Joondalup, Western Australia. (EE)

Cox, George W., Alien Species in North America and Hawaii: Impacts on Natural Ecosystems. Washington, D.C.: Island Press, 1999. 400pp. cloth \$60. paper \$30. Cox, Susan Jane Buck. "No Tragedy of the Commons." Environmental Ethics 7(1985):49-61. The historical antecedents of Garrett Hardin's "tragedy of the commons" are generally understood to lie in the common grazing lands of medieval and post-medieval England. The concept of the commons current in medieval England is significantly different from the modern concept; the English common was not available to the general public but rather only to certain individuals who inherited or were granted the right to use it, and use of the common even by these people was not unregulated. The types and in some cases the numbers of animals each tenant could pasture were limited, based at least partly on a recognition of the limited carrying capacity of the land. The decline of the commons system was the result of a variety of factors having little to do with the system's inherent worth. Among these factors were widespread abuse of the rules governing the commons, land "reforms" chiefly designed to increase the holdings of a few landowners, improved agricultural techniques, and the effects of the industrial revolution. Thus, the traditional commons system is not an example of an inherently flawed land-use policy, as is widely supposed, but of a policy which succeeded admirably in its time. Cox is in the department of Political Science, Northern Arizona University, Flagstaff, AZ. (EE)

Cox, Susan Jane Buck, "No Tragedy of the Commons" Environmental Ethics 7(1985):49-61. An historical analysis shows that Garrett Hardin's model of the tragedy of the commons, the English pasturage system, was not flawed, and did not lead to ruin. In real life, Hardin's model of the self-interested, rational, economic human does not exist. (Katz, Bibl # 1)

Craig, Paul P., Harold Glasser and Willett Kempton, "Ethics and Values in Environmental Policy: The Said and the UNCED." Environmental Values Vol. 2 No.2(1993):137--158. ABSTRACT: While citizens often use non-instrumental arguments to support environmental protection, most governmental policies are justified by instrumental arguments. This paper explores some of the reasons. We interviewed senior policy advisors to four European governments active in global climate change negotiations and the UNCED (United Nations Conference on Environment and Development) process. In response to our questions, a majority of these advisors articulated deeply held personal environmental values. They told us that they normally keep these values separate from their professional environmental policy activities. We interpret these findings within the context of the literature on environmental ethics and values. We suggest that environmental policy could be improved if widely held environmental values were articulated, validated, and admitted into the process of policy analysis and deliberation.

Crain, Caitlin Mullan; Bertness, Mark D., "Ecosystem Engineering across Environmental Gradients: Implications for Conservation and Management," BioScience 56 (no.3, March 2006): 211-218 (8). Ecosystem engineers are organisms whose presence or activity alters their physical surroundings or changes the flow of resources, thereby creating or modifying habitats. Because ecosystem engineers affect communities through environmentally mediated interactions, their impact and importance are likely to shift across environmental stress gradients. We hypothesize that in extreme physical environments, ecosystem engineers that ameliorate physical stress are essential for ecosystem function, whereas in physically benign environments where competitor and consumer pressure is typically high, engineers support ecosystem processes by providing competitor- or predator-free space. Important ecosystem engineers alleviate limiting abiotic and biotic stresses, expanding distributional limits for numerous species, and often form the foundation for community development. Because managing important engineers can protect numerous associated species and functions, we advocate using these organisms as conservation targets, harnessing the benefits of ecosystem engineers in various environments.

Crate, Susan Alexandra. *Cows, Kin, and Globalization: An Ethnography of Sustainability*. Walnut Creek, CA: AltiMira Press, 2006. Crate presents the first cultural ecological study of a Siberian people: the Viliui Sakha, contemporary horse and cattle agropastoralists in northeastern Siberia. The author links the local and global economic forces, and provides an intimate view of how a seemingly remote and isolated community is directly affected by the forces of modernization and globalization. She details the severe environmental and historical factors that continue to challenge their survival, and shows how the multi-million dollar diamond industry, in part run by ethnic Sakha, raises issues of ethnic solidarity and indigenous rights as well as environmental impact.

Crawford-Brown, Douglas, and Neil E. Pearce. "Sufficient Proof in the Scientific Justification of Environmental Actions." Environmental Ethics 11(1989):153-67. Environmental actions require a willingness to act, which, in turn, is stimulated partially by the belief that an action will yield the desired consequences. In determining whether an actor was justified in exerting the will to act, therefore, it is essential to examine the nature of evidence offered by the actor in support of any beliefs about the environment. In this paper we explore the points in environmental risk analyses at which evidence is brought to bear in support of inferences concerning environmental effects of regulatory actions. The intent is to provide a framework for discussing the manner in which evidence may provide a sufficient basis for ethically sound decisions for environmental actions. Pearce is at the Wellington Clinical School of Medicine, Wellington, New Zealand. Crawford-Brown is at the School of Public Health, University of North Carolina, Chapel Hill, NC. (EE)

Crawford, Jennifer, The Sustainable Self: An Inquiry into the Metaphysics of Sustainability and the Self. Environmental Paper No. 10. Graduate School of Environmental Sciences, Department of Geography and Environmental Science, Monash University, Melbourne, Victoria 3168, Australia. 1993. 70 pages. ISBN 0 909685 51 7. The monograph, developed from a Master's thesis there, considers the meaning of Self realization, introduced into environmental thought by deep ecologists. The term was borrowed from Gandhi and transplanted into Western environmental philosophy, a "conceptual colonization" that has, to the great loss of ecophilosophy, deformed the traditional meaning of both Self realization and the Self. The author argues for a return to Gandhi's concept, against the Western loss of the vertical dimension of being, which leaves an impoverished sense of reality and of self. She critiques the work of deep ecologists. Their deformation of the concept of Self has created confusion and misunderstanding and even been used by some to strengthen the modern Western mind set which they purport to change. Yet the positive significance of deep ecology is acknowledged as potentially providing an opening for the reintroduction of metaphysics into our understanding of ourselves and our relationship with nature. Crawley, Michael J., ed., Natural Enemies: The Population Biology of Predators, Parasites and Diseases. Oxford: Blackwell Scientific Publications, 1992. Two dozen contributors. Relationships are usually more complex than we think. Predators may regulate prey populations in some years and in some circumstances; prey, especially herbivores, may be regulated as often by how much food is available or by parasites and diseases. A long-standing generalization is that all trophic levels are regulated by competition for resources, except for herbivores which are regulated by natural enemies. Many, perhaps most, carnivores are food-limited, what prey they can catch. But it does not follow that their prey herbivores are enemy-limited, how many of them are caught; they may be limited in numbers by food too, how much green there is to eat. (cf Crawley's overview, pp. 476-489). Crawley is in biology, Imperial College, London.

Crist, Eileen, Images of Animals: Anthropomorphism and Animal Mind. Philadelphia: Temple University Press, 1998. Seeing a cat rubbing against a person, Charles Darwin described her as "in an affectionate frame of mind"; for Samuel Barnett, a behaviorist, the mental realm is beyond the grasp of scientists and behavior must be described technically, as a physical action only. What difference does this make? In Crist's analysis of the language used to portray animal behavior, the difference "is that in the reader's mind the very image of the cat's 'body' is transfigured ... from an experiencing subject ... into a vacant object." Rejecting the notion that "a neutral language exists, or can be constructed, which yields incontestably objective accounts of animal behavior," Crist argues that "language is not a neutral instrument in the depiction of animals, and, in particular, it is never impartial with respect to the question of animal mind." Crist is at the Center for Interdisciplinary Studies, Virginia Polytechnic Institute. (v9,#2)

Crist, Eileen, "Quantifying the Biodiversity Crisis," Wild Earth 12 (no. 1, 2002):16-19. Quantitative estimates of species lost are necessary, but always inadequate, due to inherent difficulties in obtaining them. Overstatement of such losses, when discovered and exposed by environmental skeptics, can be used to downplay the real seriousness of the biodiversity crisis. The numbers game can backfire. Too much reliance on such estimates can distract from a deeper understanding of the Earth's ecological predicament. Crist is in science and technology studies at Virginia Tech in Blacksburg. (v.13,#2)

Crist, Eileen, Images of Animals: Anthropomorphism and the Animal Mind. Philadelphia: Temple University Press, 2000. "A tension is built into the pursuit of knowledge about animal life, for it is heir to both the Cartesian verdict of an unbridgeable hiatus between humans and animals and the Darwinian affirmation of evolutionary continuity. The consequence of an intellectual and cultural heritage of opposed visions of the relationship between animals and humans is that the problematic of animal mind--whether affirmed or refuted, celebrated or doubted, qualified or sidestepped--is ever present, perhaps even the heart of the matter, in behavioral writings. Representations of animal life whether intentionally or not, are always addressing what is for Western thought a most engrossing mystery--the contentious topic of animal mind or animal consciousness. In this book I address the theme of animal mind through a comparative study of representations of animals in behavioral works. Specifically, I examine the understanding of animal life in behavioral thought, from the writings of Charles Darwin and turn-of-the-century naturalists to works of classical ethology and contemporary sociobiology.

My focus is on the powerful role that language use plays in the portrayal of animals. Even a casual examination of different writings reveals that language, far from being simply a useful, neutral tool for inquiry, plays a formative part in how animals are depicted. While the different works I examine are kindred in their focus on naturally occurring animal behavior, they represent animal life in very discrepant ways. My aim is to elucidate how different portrayures of animals are created. The works I study belong to the genre of behavioral science, in that the authors examined all share the ideal of discovering the realities of the natural lives of animals. It is paradoxical, then, that while they have this common goal of arriving at faithful representations of animals--documenting with great care their life histories, habits, and instincts--they nevertheless often reveal realities that are worlds apart. I approach this paradox of striking discrepancies in the portrayal of animals by focussing on the effects of diverse linguistic mediums" (pp. 1-2) (v.13,#2)

Crist, Eileen, Images of Animals: Anthropomorphism and the Animal Mind. Philadelphia: Temple University Press, 1999.

Crist, Eileen. "Against the Social Construction of Nature and Wilderness." Environmental Ethics 26(2004):5-24. The application of constructivism to "nature" and "wilderness" is intellectually and politically objectionable. Despite a proclivity for examining the social underpinnings of representations, constructivists do not deconstruct their own rhetoric and assumptions; nor do they consider what socio-historical conditions support their perspective. Constructivists employ skewed metaphors to describe knowledge production about nature as though the loaded language use of constructivism is straightforward and neutral. They also implicitly rely on a humanist perspective about knowledge creation that privileges the cognitive sovereignty of human subject over nature. Politically, the constructivist approach fails to take the scientific documentation of the biodiversity crisis seriously; it diverts attention toward discourses about the environmental predicament, rather than examining that predicament itself; and it indirectly cashes in on, and thus supports, human colonization of the Earth. Crittenden, Chris, "Self-deselection: Technopsychotic annihilation via cyborg," Ethics and the Environment 7(no. 2, 2002):127-152. The cry that advanced machines will come to dominate human beings resounds from the time of the Luddites up to the current consternation by the chief scientist of Sun Microsystems, Bill Joy. My theme is a twist on this fear: self-deselection, the possibility that humans will voluntarily combine their own bodies with technological additions to the point where it could reasonably be said that our species has been replaced by another kind of entity, a hybrid of human and radical enhancement, whether that enhancement stems from genetic alteration or the affixing of robotic parts. The paper discusses why this danger exists, focusing mainly on perilous psychological and cultural tendencies (though the amazing rate of technological change and its likely course are discussed). It then proceeds with arguments as to why such deselection is a kind of suicide and why this suicide would be a bad thing in the context of early twenty-first-century society. In the last section, ecofeminist theory is employed to generate a therapeutic ethic of social and political relationship that contrasts with a patriarchal model of dominative control through aggressive science. (E&E)

Crittenden, Chris. "Subordinate and Oppressive Conceptual Frameworks: A Defense of Ecofeminist Perspectives." Environmental Ethics 20(1998):247-63. I first demonstrate that Beth Dixon's central arguments challenging Karen Warren's "logic of domination" do not succeed. Second, I argue that the logic of domination not only connects the oppression of women and animals--a possibility that Dixon disputes--but it in fact plays a significant role in connecting these oppressions, and many others besides, in its capacity as a component of a larger oppressive conceptual framework. My negative arguments against Dixon provide a foundation for the positive arguments in the second half of the paper, wherein, in contravention of her project, I establish that humans and animals clearly share emotions in a philosophically interesting sense, that this affective similarity allows us to draw conclusions about the oppression of animals from situations oppressive to humans, and, the main thesis, that the suffering of women, animals, and other oppressed groups is the symptom of a ubiquitous mindset morally untenable, psychologically dysfunctional, and characterized by an ideology of superior/inferior-dominator/dominated thinking. Crittenden is in philosophy, University of Tennessee, Knoxville. (EE)

Croll, D. A., et al, "Introduced Predators Transform Subarctic Islands from Grassland to Tundra," Science 307(25 March 2005):1959-1961. Arctic foxes, introduced to the Aleutian Islands by fur traders looking to expand their supply from the 1700's onward, have upset the original grassland ecosystems. Once the islands were grasslands and inhabited by seed-eating Aleutian geese. The foxes drove the geese near extinction and also ate the eggs and hatchlings of puffins, auklets and other ocean feeding seabirds. As the birds faded, so did their excrement, which had been a natural fertilizer for the grasses. The grasses disappeared and left sparse tundra. Despite the foxes, the islands still remain home to 10 million seabirds that nest on cliffs.

Cromartie, Michael, ed., Creation at Risk? Religion, Science, and Environmentalism. Grand Rapids, MI: Eerdmans, 1995. 166 pages. Paper, \$ 15.00. Ten scholars and activists explore and clash over some of the scientific, religious, moral, philosophical, economic, and political claims proposed by contemporary environmentalists. Is green utopianism becoming the new communism? The Rio Climate Convention and the use of failed computer forecasts of temperature changes as the basis for public policy. Global warming. Theological implications of biocentrism. The relative merits of governments and markets in dealing with ecological problems. (v7,#1)

Cronon, William, ed., Uncommon Ground: Toward Reinventing Nature. New York: Norton, 1995. Environmental historians worrying about the cultural construction of nature. Contains Cronon, "The Trouble With Wilderness; or, Getting Back to the Wrong Nature." Cronon starts out by claiming that our concept of wilderness has to be reinvented in that it is a social construction. Sometimes he seems to adopt the postmodernist claim that there is no reality accessible beyond human words. But by the end of the article he returns to the conservation of wild nature: "I hope it is clear that my criticism in this essay is not directed at wild nature per se, or even at efforts to set aside large tracts of wild land, but rather at the specific habits of thinking that flow from this complex cultural construction called wilderness. It is not the things we label as wilderness that are the problem--for nonhuman nature and large tracts of the natural world do deserve protection--but rather what we ourselves mean when we use that label" (p. 81). "I also think it no less crucial for us to recognize and honor nonhuman nature as a world we did not create, a world with its own independent, nonhuman reasons for being as it is" (p. 87). Sounds like Cronon has gotten right back to wilderness after all.

Other essays: Carolyn Merchant, "Reinventing Eden: Western Culture as a Recovery Narrative"; "James D. Proctor, "Whose Nature? The Contested Moral Terrain of Ancient Forests"; Giovanna Di Chiro, "Nature as Community: The Convergence of Environment and Social Justice." Also a bibliography. Cronon is professor of environmental history at the University of Wisconsin. (v6,#4)

Cronon, William Nature's Metropolis: Chicago and the Great West. Norton, 1991. "But the labor theory of value cannot by itself explain the astonishing accumulation of capital that accompanied Chicago's growth. Human labor may have been critical ... but much of the value in such commodities came directly from the first, not second, nature. The fertility of the prairie soils and the abundance of the northern forests had far less to do with human labor than with autonomous ecological processes. ... The abundance that fueled Chicago's hinterland economy thus consisted largely of stored sunshine: this was the wealth of nature, and no human labor could create the value it contained ... "The social relations of production ... themselves depended on still more encompassing ecological relations on consumption. In any ecosystem, only the sun produces. ... Since no organism can make energy, each must do its best to store it, accumulating a stockpile for use when the sun will not be so generous with its gifts. The same is true of human society: most of the labor that goes into 'producing' grain, lumber, and meat involves consuming part of the natural world and setting aside some portion of the resulting wealth as 'capital.' To apply for a moment the language of economy to the ecology of the Great West, Chicago's explosive growth was purchased at the expense of prairies and forests that had spent centuries accumulating the wealth that now made 'free land' so attractive. Much of the capital that made the city was nature's own" (pp. 149-151). (v4,#2)

Cronon, William. Feature article, "An Environmentalist on a Different Path: A Fresh View of the Supposed 'Wilderness' and Even the Indians' Place in It," New York Times, April 3, 1999, p. A15, A17. "The ideal of wilderness is a fantasy and a threat." A fantasy because the American continent was already thoroughly altered by native Americans long before the Europeans came. A threat because wilderness is

no model for the human/nature relations, it sets a stark opposition between nature and culture; the needed model is one where humans are to be in harmony with nature. Gary Snyder is not so impressed: "I must confess I am getting a bit grumpy about the dumb arguments being put forth by high-paid intellectual types in which they are trying to knock Nature, knock the people who value Nature and still come out smelling smart and progressive." Cronon is in environmental history at the University of Wisconsin. (v.10,#1)

Crosby, Donald A., A Religion of Nature. Albany, NY: State University of New York Press, 2002. Nature as a proper focus of religious commitment and concern. Nature--envisioned as without God, gods, or animating spirits of any kind--is religiously ultimate. Nature is also metaphysically ultimate, that is, self-sustaining and requiring no explanation for its existence beyond itself. Moreover, humans are viewed as an integral part of nature, natural beings in the fullest sense of the term. They are at home in the natural world, their origin, nature, and destiny lie here and not in some transcendent realm, and their moral and religious responsibilities extend not only to one another and to the human community but to the whole of nature and to all living beings.

Crosby urges us to grant to nature the kind of reverence, respect, love, and devotion we in the West have formerly reserved for God. He explores such topics as the concept of nature, the character and status of natural values, commonalities and differences between humans and other forms of life on earth, and the place of humans in the natural order. Finally, he makes a case for a religion of nature by showing how nature can function as an appropriate focus of religious commitment, responding to six basic objections to a religion of nature, and explaining why nature should be regarded as the ultimate source of and impetus toward goodness in the world. Crosby is professor of philosophy, Colorado State University, emeritus. (v.13,#4)

Crosby, Donald A., "From God to Nature: A Personal Odyssey," Religious Humanism 25 (no. 3, Summer, 1991):107-116. "Human beings, therefore, do not transcend nature in their essential being, as had traditionally been thought and as I myself had long believed, but are product and expression of its immanent powers. For a time I had been attracted to religious humanism as an alternative to theism, but now I began to realize that human beings, as one spin-off of the irrepressibly creative workings of nature, should not be regarded as religiously ultimate in themselves but rather as evidencing, along with other forms of emergent life, the ultimacy of an all-encompassing nature." Crosby is professor of philosophy at Colorado State University, Fort Collins. (v3,#1)

Cross, Frank B., "The Subtle Vices Behind Environmental Values," Duke Environmental Law and Policy Forum 8(1997):151- . The apparent virtues of environmentalism may obscure a darker underside. Public perceptions of risks associated with the environment are often mistaken and should not be relied on for risk regulation. Public perceptions are selfish and people act in their own self interest, not in community interest. Democracy does not compel reliance on public perceptions. (v.10,#1)

Cross, Frank B. "Natural Resource Damage Valuation." Vanderbilt Law Review 42 (March 1989): 269-341. Natural resource destruction results from the status of public lands as a common good in a capitalist system. Establishing accurate means for valuing natural resources transcends the current procedures. Broadly used, the right to recover natural resource damages can force the internalization of many pollution costs and thus create a powerful deterrent to future environmental harm. Government action has achieved some success, but the mechanism has inherent limitations and may always trail behind the creative force of the market and the harm that it may cause. The job of protecting natural resources pertains to government functions that are too large, complex, or widely dispersed for government to perform. Instilling private marketplace decisions with a concern for harm to nature is a vital and necessary complement to government intervention in the market. To be truly effective, however, such recovery must capture the full value of harm done to resources. At present, natural resource valuation seriously understates the true social harm done to natural resources. The author proposes better valuation procedures, with special reference to Superfund. Another good example of an article that philosophers should read before they complain that lawyers do not do their philosophical homework. Cross teaches business law in the Department of Management, University of Texas. (v6,#1)

Crotty, Sean, Single Track Mind: Cycling and the Evolution of the American Nature Ideal. M.A. thesis in environmental history, Colorado State University, spring 1999. "Americans have constructed a natural idea in which machines are no longer an intruder in the garden, but rather indispensable tools for uncovering and enjoying nature's wonders." (Introduction). This includes automobiles, freeze-dried foods, Gore-tex jackets, cross-country skis, and mountain bikes. 63% of mountain bikers consider themselves environmentalists. They often drive an hour or more to put a \$ 1,500 bike into the woods. Bicycling has a long history of country cycling, and it can be a means of getting people out of their houses and cars and into more experience of nature, whether on suburban bikeways or mountain trails. The bicycle is, in some situations, "the most benevolent of the machines" (p. 38). "If nature is (socially) constructed, if it is indeed a blank screen awaiting the projection of human values, and if one of those values is technology, then mountain biking has the eco-friendly image that it does because it represents the culmination of an American idea of nature, constructed throughout this century" (p. 59).

Why not then bikes in designated wilderness? Earlier regulations prohibited only "contrivances

powered by a non-living power source," but today "mechanized transport" is prohibited (p. 85). Once it was no motors, now it is no gears. But clothing, pocket knives, axes, stoves, metal frame backpacks are o.k., even guns (where hunting is permitted) Or cellular phones, and satellite location devices. Crotty's conclusion is that the no-bikes-in-the-wilderness rule is justified only by degree of adverse impact, were large numbers of bikers to ride the wilderness trails. For the same reasons, horses or Vibram boots could be banned. There is no question of banning technology from the wilderness for purity of wilderness experience; modern humans cannot and will not go there without it. Crotty was formerly a professional mountain bike racer. (v.10,#1)

Crouch, Martha L. "Biotechnology Is Not Compatible with Sustainable Agriculture." Journal of Agricultural and Environmental Ethics 8(1995):98-111. Biotechnology increases commercialization of food production, which competes with food for home use. Most people in the world grow their own food, and are more secure without the mediation of the market. To the extent that biotechnology enhances market competitiveness, world food security will decrease. This instability will result in a greater gap between rich and poor, increasing poverty of women and children, less ability and incentive to protect the environment, and greater need for militarization to maintain order. Therefore, biotechnology should be discouraged. An active program to protect and strengthen local food production and to decrease reliance on industrial agriculture should be promoted. (JAEE)

Crowards, Tom, "Nonuse Values and the Environment: Economic and Ethical Motivations," Environmental Values 6(1997):143-167. ABSTRACT: Nonuse values are a potentially very important, but controversial, aspect of the economic valuation of the environment. Since no use is envisaged by the individual, a degree of altruism appears to be the driving force behind nonuse values. Whilst much of the controversy has focused upon measurement issues associated with the contingent valuation method, this paper concentrates on the underlying motivations, whether ethical or economic, that form the basis for such values. Some fundamental aspects of defining and quantifying economic nonuse values are considered, and possible motives for attributing value to the environment are analysed, making a clear distinction between selfish altruism and selfless altruism. The difference has crucial implications for economic valuation and for assessing individuals willingness to pay for environmental quality. The concept of Safe Minimum Standards is introduced as a means of supplementing purely economic methodology to incorporate ethical concerns into decision making. Crowley, Kate, "Lake Pedder's Loss and Failed Restoration: Ecological Politics Meets Liberal Democracy in Tasmania," Australian Journal of Political Science 34 (no. 3, 1999):409-424. The flooding

of Lake Pedder in South West Tasmania for hydro-electricity in the early 1970's is recognized as one of the world's great ecological tragedies. The hope for its restoration, long held by some, has been given impetus by the activities of Pedder 2000, a nation-wide restoration lobby group founded in 1994. The legitimacy, feasibility and desirability of Pedder's restoration has been acknowledged, if not endorsed, by a recent federal inquiry. Restoration proponents see Pedder's recovery not only as a means of making amends for past follies, but as a new millennium project that offers hope to future generations. This paper reviews Pedder's inundation and the efforts towards its recovery, and finds little support for restoration in the absence of compelling economic and political benefit. This is cause to reflect, it is argued, upon the difficulties that ecological politics has encountered within Tasmania that saw Lake Pedder dammed in the first place. Csete, Marie E., and Doyle, John C., "Reverse Engineering of Biological Complexity," Science 295(1 March 2002):1664-1669. In a symposium on biological systems. There is a "deep and necessary interplay between complexity and robustness, modularity, feedback, and fragility." Maybe "stability" is no longer in vogue in biological systems, but the new replacement seems to be "robustness." A key is "robustness, the preservation of peculiar characteristics despite uncertainty in components or the environment" (p. 1664). As important as modules are "protocols," "rules designed to manage relationships and processes smoothly and efficiently." "A good protocol is one that supplies both robustness and evolvability" (p. 1666). Robustness is continually at the edge of fragility, as pressures to optimize robustness venture mutants that can result in the collapse of the system. Complex human technological systems, such as a Boeing 777, and complex organisms, such as a flying bird, have more in common than is commonly thought. Csete is in developmental biology, University of Michigan Medical School, Ann Arbor; Doyle is in electrical engineering and bioengineering, California Institute of Technology. Pasadena. (v.13, #3)

Cullen, James, A Systems Approach to Environmental Values: Systems Process and the Bifurcation of Nature. Master's thesis, Lancaster University, U.K. 1994. "Our current environmental predicament, it is claimed, is the consequence of what Whitehead called 'the bifurcation of nature'. This crisis is said to have stemmed from Descartes' cogito and to still prevail today. In order to overcome this dualistic worldview, the idea of life as a process is introduced. From this dynamic appraisal, systems thinking is put forward as a fundamentally more organic alternative to mechanistic presuppositions about the world. Non-hierarchical structure is then discussed via an appraisal of the significant relationships that all things have. In conclusion, 'systemic' value is offered as an holistic alternative to the fallacy of simplistic value division and imposition." (v6,#4)

Cunningham, Andrew A., and Daszak, Peter, "Extinction of a Species of Land Snail Due to Infection with a Microsporidian Parasite," Conservation Biology 12(1998):1139-1141. The first documentation of an infection wiping out the last of a species. South Pacific snails are rare in nature. In the Society Island chain, 5,000 km. west of Hawaii, residents imported predatory snails from Florida to eat another imported snail that had become a pest. That was in 1986. But the new import preferred native snails. Scientists from the Zoological Society of London captured the last known individuals of Partula turgida to try to save them through a breeding program, in 1991. But, starting about 1994, the population dwindled from about 300 to 10. Scientists became alarmed, but by the time they found out the trouble, it was too late. The snail became extinct. The cause was a new species of a microsporidian protozoan in the genus Steinhausia that had ravaged the snails digestive tracts. So endangered species recovery programs can be hazardous too. A summary story is Ferber, Dan, "Bug Vanquishes Species," Science 282(9 October 1998):215. Cunningham is at the Institute of Zoology, Regent's Park, London. Cuomo, Christine J. "Unravelling the Problems in Ecofeminism." Environmental Ethics 14(1992):351-63. Karen Warren has argued that environmental ethics must be feminist and that feminist ethics must be ecological. Hence, she endorses ecofeminism as an environmental ethic with power and promise. Recent ecofeminist theory, however, is not as powerful as one might hope. In fact, I argue, much of this theory is based on values that are potentially damaging to moral agents, and that are not in accord with feminist goals. My intent is not to dismantle ecofeminism, but to analyze and clarify some of the philosophical problems with recent ecofeminist work and to point out a more promising direction for ecofeminist ethics. Cuomo is in the department of philosophy, University of Cincinnati, Cincinnati, OH. (EE)

Curry, Patrick, "Re-Thinking Nature: Towards an Eco-Pluralism," *Environmental Values* 12(2003): 337-360. Both scientific realism and social constructionism offer unpromising and even destructive ways of trying to understand nature and human-nature relations. The reasons include what these apparent opponents share: a commitment to the (latterly) modernist division between subject/culture and object/nature that results from what is here called 'monist essentialism'. It is contrasted with 'relational pluralism', which provides the basis of a better alternative - ecopluralism - which, properly understood, is necessarily both ecocentric and pluralist. (EV)

Curry, Patrick, "Redefining community: Towards an ecological republicanism," *Biology and Conservation* 9(2000):1059-1071. Abstract. This paper makes some suggestions for a concept of community which arguably satisfies the most important criteria for both human communities, as defined in the social sciences and humanities, and natural communities, as defined in ecology and biology. Beginning with the former, I arrive at two such criteria: (1) a material and social connection, among members, and (2) some kind and degree of awareness of other members. These are then supplemented with a third drawn from civic republicanism, with its focus on citizenship and the common good: communities (3) enable and require certain practices for their maintenance. Turning to ecological definitions of community, I find the dominant (reductionist) one seriously deficient as compared with a more holist and ecosystemic approach. However, I invoke a nonreductive holism to defend the idea of community, and go on to argue that each of the three above-mentioned criteria can be fruitfully extended to include both social and ecological communities in a nonreductionist way--that is, in a way that neither reduces ecosystemic properties to individual organisms nor the reverse. This culminates in a discussion of what I call 'ecological republicanism', which I suggest could have powerfully positive effects on the contemporary crisis of undue human impact on the natural world. Key words: community, ecological republicanism, reductionism, the common good, virtue. Curry lives at 10 Burnand House, Redan Street, London W14 OLW, UK. (v.13,#1)

Curry, Patrick, *Ecological Ethics: An Introduction*. Cambridge: Polity Press, 2006. A wide-ranging and pithy introduction, accessible to those who know little about the field and are willing to think seriously and philosophically. "This book therefore doesn't advocate ethics by 'extension' from human beings through other animals. ... Rather, I start from the belief, or perception, that nature--which certainly includes humanity--is the ultimate source of all value. ... So, as Richard Sylvan and David Bennett put it, 'the ecological community forms the ethical community'." (p. 2). Curry is good at getting some angle on truth from diverse positions and keeping a balancing act as he pursues his way through "light green or shallow (anthropocentric) ethics" (Chapter 6), "mid-green or intermediate ethics" (Chapter 7) to reach a "dark green or deep (ecocentric) ethics" (Chapter 8). He has also a serious interest in an "ecocentric spirituality" (Chapter 9). Curry is at the Sophia Centre, Bath Spa University, UK.

Curry, Patrick. "Redefining Community: Towards an Ecological Republicanism," *Biodiversity and Conservation* 9(no. 8, 2000):1059-1071. Abstract. This paper makes some suggestions for a concept of community which arguably satisfies the most important criteria for both human communities, as defined in the social sciences and humanities, and natural communities, as defined in ecology and biology. Beginning with the former, I arrive at two such criteria: (1) a material and social connection among members, and (2) some kind and degree of awareness of other members. These are then supplemented with a third drawn from civic republicanism, with its focus on citizenship and the common good: communities (3) enable and require certain practices for their maintenance. Turning to ecological definitions of community, I find the dominant (reductionist) one seriously deficient as compared with a more holistic and ecosystemic approach. However, I invoke a nonreductive holism to defend the idea of community, and go on to argue that each of the three above-mentioned criteria can be fruitfully extended to include both social and ecological communities in a nonreductionist way that is, in a way that neither reduces ecosystemic properties to individual organisms nor the reverse. This culminates in a discussion of what I call "ecological republicanism", which I suggest could have powerfully positive effects on the contemporary crisis of undue human impact on the natural world. Key words: community, ecological republicanism, reductionism, the common good, virtue.

Curry-Roper, Janel M., "Contemporary Christian Eschatologies and their Relation to Environmental Stewardship," *The Professional Geographer* 42(1990): 157-169. Contemporary Protestant Christians hold differing views that affect their attitudes toward the environment. Dispensationalism tends to use ecological deterioration as a gauge to predict Christ's return and the end of the present age. Postmillennialism teaches that the natural and human world will improve up to Christ's return and puts responsibility on Christians for that improvement. Amillennialism and Historic Premillennialism teach that the possibility of ecological and social improvement is limited in the present age though Christians are to attempt to heal the Earth's wounds to show evidence of a future renewed Earth." Roper is professor of geography at the Central University of Iowa, Pella. (v3,#4) (v2,#1)

Curtin, Deane, *Chinnagounder's Challenge: The Question of Ecological Citizenship*. Bloomington: Indiana University Press, 1999. Environmental ethics with a focus on the third world. The arguments used in the West are often out of context in other cultures. Systematic features of the ways we in the West tend to organize moral experience encourage us to believe we have understood profoundly different cultures when we do not. In result, when we try to help, we fail.

Nature and culture; living at the margins. The British utilitarians and the invention of the "Third World." The politics of agricultural "modernization." Gandhian legacies: indigenous resistance to "development" in contemporary India and Mexico. Recognizing women's environmental expertise. Radical first world environmental philosophy: a new colonialism? Callicott's land ethic. (Callicott is too

monist; not pluralist enough; despite his claimed multiculturalism, in his monist zeal, "Callicott simply wipes entire continents off the map of environmental ethics" (p. 112). Ecosophy T and the Buddhist tradition. Ecological feminism and the place of caring. Democratic discourse in a morally pluralistic world. Putting down roots: ecocommunities and the practice of freedom.

Chinnagounder appears late in the book, a old man, over a hundred years old, in a village in India, who lives in the back of a stable on sheets of cardboard, and asks disconcerting questions. Curtin is in philosophy, Gustavus Adolphus College, St. Peter, MN. (v.12,#3)

Curtin, Deane, "Dogen, Deep Ecology, and the Ecological Self." Environmental Ethics 16(1994):195-213. A core project for deep ecologists is the reformulation of the concept of self. In searching for a more inclusive understanding of self, deep ecologists often look to Buddhist philosophy, and to the Japanese Buddhist philosopher Dogen in particular, for inspiration. I argue that, while Dogen does share a nondualist, nonanthropocentric framework with deep ecology, his phenomenology of the self is fundamentally at odds with the expanded Self found in the deep ecology literature. I suggest, though I do not fully argue for it, that Dogen's account of the self is more sympathetic to one version of ecofeminism than to deep ecology. Curtin is in philosophy, Gustavus Adolphus College, St. Peter, MN. (EE)

Curtin, Deane, "A State of Mind Like Water: Ecosophy T and the Buddhist Traditions," Inquiry 39(no. 2, June, 1996):239-253. Arne Naess has come under many influences, most notably Gandhi and Spinoza. The Buddhist influence on his work, though less pervasive, provides the most direct account of key deep ecological concepts such as Self-realization and intrinsic value. I read Ecosophy T as a rigorously phenomenological branch of Deep Ecology. Like early Buddhism, Naess responds to the human suffering that causes environmental destruction by challenging us to return to the reality of lived experience. This Buddhist reading clarifies, but it also complicates. It reaffirms Naess's essential vision, but it challenges him at two points: first, to affirm that Self-realization is a process of co-realization with all beings, not just with sentient beings. Second, while this reading accepts that humans do not create the value of nature, it questions whether its value is best expressed in terms of the 'intrinsic value' of radical environmental ethicists." Curtin is at Gustavus Adolphus College, St. Peter, MN. (v8,#3)

Curtin, Deane. "Making Peace with the Earth: Indigenous Agriculture and the Green Revolution." Environmental Ethics 17(1995):59-73. Since its inception in the years following World War II, the green revolution has been defended, not just as a technical program designed to alleviate world hunger, but on moral grounds as a program to achieve world peace. In this paper, I dispute the moral claim to a politics of peace, arguing instead that the green revolution is warist in its treatment of the environment and indigenous communities, and that the agricultural practices that the green revolution was designed to supplant principally indigenous women's agriculture are forms of ecological peacemaking, akin to pacifism. I argue, as well, that the warist intentions of the green revolution are characteristic of a form of domination called developmentalism. A complete understanding of domination necessitates linking developmentalism with other forms of domination such as racism, sexism, and naturism. Curtin is with the philosophy department, Gustavus Adolphus College, St. Peter, MN. (EE)

Curtis, Allan, Birkhead, Jim, De Lacy, Terry. "Community Participation in Landcare Policy in Australia: The Victorian Experience with Regional Landcare Plans," *Society & Natural Resources* 8(no.5, Sept. 1995):415- . (v6,#4)

Curtis, Allan, De Lacy, Terry, "Landcare, Stewardship and Sustainable Agriculture in Australia," *Environmental Values* 7(1998):59-78. There are over 2,500 Landcare groups with 65,000 members operating across Australia. With considerable evidence of program impact, Landcare is an important example of state sponsored community participation in natural resource management. However, the authors suggest excessive emphasis has been placed upon attitudinal change - the development of landholder stewardship, as the lever for effecting major changes in land management. Analysis of data from a landholder survey failed to establish predicted stewardship differences between Landcare and nonLandcare respondents or between those who joined early/late, or participated more/less in group activities. And there was no relationship between stewardship and adoption for most of the sustainable agriculture practices surveyed. Further analysis clearly linked Landcare participation and concern about the environmental and economic impacts of land degradation. Whilst respondents were significantly more concerned about economic impacts, research findings were consistent with earlier work indicating that most land managers have a strong stewardship ethic. The authors also suggest that concerns that Landcare is not addressing biodiversity conservation are largely unjustified and reflect unrealistic expectations of these voluntary groups. KEYWORDS: Landcare, stewardship ethic, sustainable agriculture, Australia, community participation, rural development. Allan Curtis is at Charles Sturt University. Terry De Lacy is at University of Queensland. (EV)

Curtis, John A., "Ethics in Wildlife Management: What Price?" *Environmental Values* 11(2002):145-161. This paper argues that there may be instances where assessing wildlife for monetary valuation might be quite reasonable and useful for public policy, even when there are strong arguments against valuation of wildlife and nature. A case of deer population management is considered where continued growth of the deer population will lead to more property damage and habitat loss. However, deer population control raises ethical questions on the rights of animals to exist and on the rights of humans to arbitrarily interfere. The contingent valuation methodology (CVM) is used to value preferences for deer management for the purpose of guiding public policy. The valuation estimates show that ethical concerns about killing deer affect the level of willingness to pay in a quite a logical manner. However, for individuals with rights-based preferences, CVM is not appropriate. The survey results also show that individuals with rights-based preferences are a small minority in this particular example. (EV)

Curtis, Mark. "The Ambiguities of Power: British Foreign Policy Since 1945." *The Ecologist* 26, no.1 (1996): 5. Britain's dealings with the Third World are generally assumed to be motivated by a desire to promoting democracy, human rights and economic well-being. However, a close scrutiny of Britain's foreign policy since 1945 reveals a very different story. Far from being benevolent, Britain has consistently contributed to economic and political oppression. (v7, #3)

Curtis, Stanley E., "Future Directions of Science and Public Policy", *Journal of Agricultural and Environmental Ethics* 6(1993). The issue of farm animal welfare today is very complex. Increasing the welfare-supportive quality of an animal production system usually increases production cost. In already

adequate animal environments, there is little profit incentive - and likewise little moral imperative - to increase environmental quality. But activists do not seek adequate or optimal remedies; they seek maximal animal well-being. Nevertheless, in reality, this begs compromise, so political debate is inevitable. Advocates on one side tend to let feelings lead them to argue that common sense should suffice to guide lawmakers to regulate production practices strictly, while those on the other side tend to argue that producers are doing as well as possible. Both sides seem to ignore the fact that scientific knowledge of farm animal well-being is attainable and should serve as the basis for discussion. In the United States a political solution may soon determine farm animal care practices and procedures. Instead of this, we need to ask the animals to answer questions such as "how big should the pen be?" through scientific experiments. Until we can answer such questions with authority, we have no business passing laws and writing regulations setting design specifications for animal accommodations. Establishment of such regulations now would be premature. We need more information about what constitutes animal well-being - particularly psychological aspects. It matters not what anyone might think constitutes that state. What it takes is what it takes, regardless of what anybody opines. We need to increase our knowledge of animal well-being so that some day we can formulate design specifications. Curtis is in the Department of Dairy and Animal Science, College of Agricultural Sciences, The Pennsylvania State University, 324 William L. Henning Building, University Park, Pennsylvania 16802.

Curtler, Hugh Mercer, Ethical Argument: Critical Thinking in Ethics. New York: Oxford University Press, 2004. A section of the discussion cases is on "The Environment." Cutler is in philosophy, Southwest Minnesota State University.

Curzon, Carrie, "Ecotourism - Conservation Ethics - Profit: Getting it Right in the Eastern Transvaal," Africa - Environment and Wildlife 1(no. 2, July-August 1993):36-42. Four game reserves along the western flank of Kruger National Park--Sabi Sand, Timbavati, Manyeleti, and Klaserie--have luxury lodges for high priced ecotourism and close encounter with wildlife. The lodges try to use local materials, labor, and supplies, and claim that they are committed to sound environmental principles, hoping to give credence to the term ecotourism. Fences have come down between the park and the reserves; animals roam where they will. Reserve managers have been following the advice of ecologists in the restoration of lands once degraded by cattle. Ecotourism is a major factor in earning foreign exchange. Still, there is the criticism of a high paying international elite enjoying wildlife while masses of the poor blacks are not far away. Meanwhile, wildlife viewing is much cheaper at nearby Kruger Park. Curzon is a free lance journalist. (v6,#3)

Cushman, John, "Buried in Measure on Toxic Waste: One Special Offer," New York Times (9/5/97): A1. Superfund revision would prohibit compensation for lost intrinsic value. One of the sticking points in the attempt to reauthorize the Superfund toxic waste law concerns whether companies can be sued for damage to the intrinsic value of natural resources and whether they can be forced to try to restore them. Montana Senator Max Baucus objected to a proposed weakening in the Superfund law by saying it "completely overlooks the intrinsic value of a remote mountain wilderness." The revision would prohibit seeking damages for intangible environmental values that cannot be easily priced. The Assistant Attorney General of New York argues that "unique resources are valuable to society not only for their actual uses as parks, waterways or recreational facilities, but because they just are." A spokesperson for a coalition of industry groups opposed to penalties for long-term environmental restoration says that some lawsuits "are going to attempt to compute the value to the squirrel of having to eat acorns instead of walnuts while restoration is occurring, or the value to a robin of eating bugs instead of worms--and to file claims for the robin's pain and suffering." (v8,#3)

Cushman, John H., Jr., "Courts Expanding Effort to Battle Water Pollution: New Enforcement Tactic," New York Times, National, March 1, 1998, p. 1, p. 16. A hitherto little used provision in the 1972 Clean

Water Act allows states to measure water pollution more broadly, including nonpoint sources, and to impose across-the-board limits on pollution from all sources until clear water standards can actually be met. Courts are now tending to uphold this aspect of the law, which means that all development can be held up until the nonpoint source problem is addressed. (v9,#1)

Cushman, John, "One Million Acres of Wetlands Was Lost From 1985 to 1995, Despite New Protections," New York Times (9/18/97): A18. Wetlands Loss Continues. Despite a nearly decade-old policy of no-net loss of wetlands, between 1985 and 1995, the U.S. lost a total of over 1 million acres of wetlands (1600 square miles). One half of this loss occurred in the Southeast. The ten year loss was 1 percent of total wetlands in the 48 contiguous states, which have lost 50 percent of their wetlands since colonial times. There once were over 200 million acres in the "lower 48 states"; now 100 million acres remain (Alaska has 170 million acres left). Fortunately, the rate of wetland loss is slowing: From 1965 to 1975 the loss was 5 million acres and from 1975 to 1985 the loss was 3 million acres. Still, 100,000 acres are lost a year. Of particular concern are the forested wetlands of the Southeast. In the last decade, 2.5 million acres of swamp were lost, 5 percent of the 50 million acres of swamp remaining. Much of this isn't reflected in the overall loss statistics, because after they are logged, shrubs may remain and this type of wetland (shrub wetland) actually increased in the ten year period, offsetting other losses. Many forested wetlands were drained entirely and converted to pine farms or croplands. Other increases in wetlands include freshwater ponds (e.g., development retention ponds and water traps on golf courses and agricultural fields). Wetlands provide a number of important functions including flood control, pollution filtering, protection from erosion, and wildlife nursery and habitat. (v.8,#4)

Cushman, John H. Jr., "Scientists are Turning to Trees to Repair the Greenhouse," New York Times, March 3, 1998. Planting trees is by no means the whole solution, but it can be an important part of it. (v9,#1)

Cushman, John, "Pollution Policy is Unfair Burden, States Tell E.P.A.," New York Times (5/10/98): A1. Debate over policy to stem environmental racism. A U.S. Environmental Protection Agency (EPA) policy aimed at lessening the disproportionate burden of pollution endured by poor and minority communities has provoked a strong reaction from State environmental agencies and business groups. The EPA's office of civil rights has issued guidelines suggesting that if a pollution permit issued by a state contributes to a pattern of disproportionate pollution in a minority neighborhood, then it may be treated as a violation of the anti-discrimination provisions of the Civil Rights Act of 1964. Thus even if pollution permits that states issue to businesses passes all the ordinary tests of environmental laws, states could face a loss of Federal money or a possible a lawsuit if such permits contribute to environmental injustice. A U.S. Chamber of Commerce official objects that the policy runs counter to Federal programs designed to bring jobs and economic opportunities to low-income and minority areas and that it undermines the effort to clean-up closed contaminated industrial sites and build factories there. Over 50 complaints challenging the location of incinerators, dumps, and factories have been filed over the last 5 years. . Environmental justice advocates think the policy is too weak and should make it clear that discrimination can occur not just by exposure to pollutants but also by increase in health risks, changes in land values, and the stigma of living near undesirable installations. (v.9,#4)

Cushman, John H., Jr. [New York Times News Service], Lexington [KY] Herald-Leader, 10 May 1998, A6. Challenges to the EPA policy against environmental racism. State governments and major industrial groups are challenging the EPA-Clinton administration policy against placing an unfair share of incinerators, dumps, and other sources of pollution in poor and minority neighborhoods. The opponents to the policy claim it will hamstring state and local governments, encourage frivolous lawsuits, and discourage companies from locating in depressed areas. (v9,#2)

Cushman, John H., Jr., "One Million Acres of Wetlands Was Lost From 1985-1995, Despite New

Protections," New York Times, Sept. 18, 1997, p. A18. Wetlands Lost. One million acres of wetlands was lost in the continental U.S. from 1985-1995, despite new protections, according to a U.S. Fish and Wildlife survey. The losses on agricultural lands were especially surprising, 965,000 of these acres, indicating lack of enforcement of wetland protections on the farm. Still, many interpreted the report as good news, since losses in the previous decade, 1975-1985 were three million acres. The loss was about one percent of the wetlands that remain in the lower 48 states, which now have less than half the wetlands that existed in Colonial times. (v8,#3)

Cushman, John, "Cuts Sought in Wasteful Fish Kills," New York Times (1/13/98): B12. Wasteful fishing practices. Because of indiscriminate commercial fishing practices, more than 20 million tons of fish, a quarter of all fish caught worldwide, are wastefully killed and discarded each year. Conservation and sports groups are pushing the National Marine Fisheries Service to reduce the "bycatch" in the American fishing industry by 75% by 2005. Recent changes in fisheries law requires the Federal Government to rebuild all depleted fish populations within 10 years (if biologically feasible), and this includes minimizing by-catch. The groups are calling for severe restrictions on the use of drifting long lines, as well as additional gear for Gulf of Mexico shrimpers, who kill an estimated four pounds of finfish for every pound of shrimp they take in. Czech, Brian, Shoveling Fuel For A Runaway Train: Errant Economists, Shameful Spenders, And A Plan To Stop Them All. Berkeley: University of California Press, Berkeley, 2000. 210p. \$22.50. ISBN 0-520-22508-2. What begins as an academic exercise ends as a public tract designed to trigger a "steady state revolution" in the United States. Shoveling Fuel was written by a Ph.D. wildlife biologist turned

ecological economist. Principles of wildlife science and evolutionary ecology applied to the workings of the human economy. Mainstream or "neoclassical" economic growth theory is fallacious, dangerous, and most likely corrupted at the nexus of academia, corporatism, and government. Debunking Julian Simon's Ultimate Resource 2, Shoveling Fuel includes an overview of ecological economics and some of its leading theorists. Part 2 provides a blueprint for the steady state revolution, which is part academic, part social. Theories of Darwin, Veblen, and Maslow are synthesized to reveal the "liquidator syndrome" afflicting many Americans. Once the motives of the liquidators and the effects of their behavior are revealed, the steady state class will begin to castigate the liquidating class. Increasingly informed by the ecological economics movement in academia, will lead to the establishment of a steady state, sustainable economy. (v.12,#4)

Czech, Brian, and P. R. Krausman. 2001. The Endangered Species Act: History, Conservation Biology, and Public Policy. Baltimore, MD: Johns Hopkins University Press, 2001 240 pp. ISBN 0-8018-6504-2, \$26.00, pb A comprehensive analyses of the Endangered Species Act, using "policy design theory", developed in the 1990s by political scientists Anne Schneider and Helen Ingram. Part 1: Overview of current ESA controversies, followed by a history of species endangerment in the United States and the sociopolitical response. Part 2: A policy design analysis of the ESA, beginning with a layout of the ESA's structure and an assessment of the assumptions of the ESA authors. Next, the allocation of recovery efforts among threatened and endangered species is assessed using a "social construction/political power matrix". The technical legitimacy of the ESA is assessed, with particular attention paid to the prioritization of species for conservation. The socioeconomic context of the ESA is described using an assessment of the causes of species endangerment, and the implications of the ESA to American democracy (and vice versa) are discussed. Special attention is given to property rights. The authors conclude that the ESA is an implicit prescription for a steady state economy of sustainable size. (v.12,#4)

Czech, Brian, et al (20 others, including a study group of the Wildlife Society), "The Iron Triangle: Why The Wildlife Society Needs to Take a Position on Economic Growth," Wildlife Society Bulletin 31(no. 2, 2003):574-577. Powerful forces exist who do not want the public to think there is a conflict between economic growth and wildlife conservation. But there is, and wildlife professionals need to address that conflict. An "iron triangle" exists; one side is special interest groups, one side is supportive political factions, and the third side is professional agencies, usually in the government; the triangle locks out other views. Neoclassical economists typically argue that there is no conflict between economic growth and wildlife conservation, but ecological economists say there is. The Wildlife Society needs to speak up. Czech is a wildlife biologist with the U.S. Fish and Wildlife Service, National Wildlife Refuge System, and chair of The Wildlife Society's Working Group for the Steady State Economy.

Dagget, Dan, "Death for the Bear," Harrowsmith's Country Life, December 1990. High-tech bear hunting, with radio telemetry computerized hounds, high-powered four-wheel drives, high-powered telescopic rifles, infrared night scopes, video-enhanced images, including the latest guerilla weapons, and all the rest. Fair chase? Nobody asks when a fast-paced business executive wants a bear quick over a weekend. Nor do many ask what this is doing to the bear populations. Dagget is conservation chairman of the Sierra Club of Northern Arizona and writes guidebooks for the United States Forest Service. (v1,#4)

Dahl, Arthur Lyon. Ecological Foundations for a New Economics: The Theory of ECOs and Its Implications for New Paradigms. Atlantic Highlands NJ: Humanities Press, Zed Books, forthcoming 1997. Dahl provides the nonspecialist with a readable understanding of scientific ecology's systems approach. In place of traditional paradigms, the author introduces the notion of ECOs. This, he argues, provides a much more accurate portrayal of the real world as a complex 'nested' structure of interacting, dynamic and constantly changing systems. (v7,#1)

Dahlberg, Kenneth A., "The Value Content of Agricultural Technologies and their Effect on Rural Regions and Farmers", Journal of Agricultural Ethics 2(1989):87-96. The premise of this article is that technologies are not neutral in terms of their design objectives, their scale, and the fact that they reflect the physical and social environments in which they have developed. The articles also examines a series of major threats such as climate change that require the rethinking and restructuring of agriculture along more sustainable lines. Dahlberg is in political science at Western Michigan University, Kalamazoo.

Daigle, J. Douglas, The Role of a Planetary Narrative in Environmental Ethics. Master's thesis at Colorado State University, spring 1993. Narrative as forming the larger unitary framework in which to understand nature and the human place in nature, with a sense of present crisis in the planetary store. The concluding chapter is on oceans interpreted as the common heritage of humankind and their role in contributing to a sense of global history. (v3,#4)

Dailey, Gretchen and a dozen others, "Food Production, Population Growth, and the Environment," Science 281(28 August 1998):1291-1292. World population has increased at a historically high average rate of 1.8% annually since 1950, but cereal production has more than kept pace. Global statistics are misleading, however. One has to look at food production through a local lens. The increased production may not be sustainable, and the social costs of such production, counting hidden costs, often exceed the market prices. The purchasing power of the poor may be so weak that they are undernourished, even if there are ample supplies. More green accounting and genuine progress indicators are needed. (v.9,#4)

Daily, G.R., (ed). Nature's Services. Review by Jon Lovett, Environmental Values 7(1998):365.

Daily, Gretchen C., and Ellison, Katherine, The New Economy of Nature: The Quest to Make Conservation Profitable. Washington, DC: Island Press, 2002. The environment generates services that have an economic value. Paying for those services, if you disrupt them, provides an open recognition of the worth of those environments, and the resulting prices provide incentives for conservation. Tradeable permits, with some cautions. Solutions have to be tried, and solutions based on mutual self-interest probably have a better chance of working than moralistic appeals to do the "right thing." (v.13,#4)

Daily, Gretchen C., ed. Nature's Services: Societal Dependence on Natural Ecosystems. Covelo, CA: Island Press, 1997. 416 pp. \$49.95 cloth, \$24.95 paper. Scientists from a variety of disciplines examine the character and value of ecosystem services, the damage that has been done to them, and the consequent implications for human society. (v8,#2)

Daily, Gretchen C. "Restoring Value to the World's Degraded Lands." Science 269(1995):350-354. About 43% of Earth's terrestrial vegetated land has diminished capacity to supply benefits to humans because of degradation, a reduction in benefits of about 10%. If present trends continue the reduction in benefits could reach 20%. Alternatively, with restoration, the reduction in benefits could be only 5%. Capitalizing on natural recovery mechanisms is urgently needed to prevent further irreversible change. (v6,#3)

Daily, Gretchen C., and Katherine Ellison, The New Economy of Nature: The Quest to Make Conservation Profitable. Washington, DC: Island Press, 2002. Natural "labour" has historically been taken to be "free." But the services of nature are worth a great deal. And it can cost a lot of money to forget this. Reviewed by Tim Rosser, Environmental Values 13(2004):139-140. (EV)

Daily, Gretchen and Ellison, Katherine, The New Economy of Nature: The Quest to Make Conservation Biology Profitable. Corvelo, CA: Island Press, 2002. Conserving natural habitats for one year instead of developing them for human use would save humanity \$ 250 billion that year and every year thereafter, according to a group of British and American ecologists. Cost-benefit analysis is a sound basis for environmental policy. (v.13, #3)

Dale, Virginia H., et al (8 others), "Ecological Guidelines for Land Use Management." Pages 3-33 in Dale, Virginia H., and Haeuber, Richard A., eds., Applying Ecological Principles to Land Management. New York: Springer, 2001. A report from the Ecological Society of America. "Five principles of ecological science have particular implications for land use and can assure that fundamental processes of the earth's ecosystems are sustained. These ecological principles deal with time, species, place, disturbance, and the landscape. The recognition that ecological processes occur within a temporal setting and change over time is fundamental to analyzing the effects of land use. In addition, individual species and networks of interacting species have strong and far-reaching effects on ecological processes. Furthermore, each site or region has a unique set of organisms and abiotic conditions influencing and constraining ecological processes. Disturbances are important and ubiquitous ecological events whose effects may strongly influence population, community, and ecosystem dynamics. Finally, the size, shape, and spatial relationships of habitat patches on the landscape affect the structure and function of ecosystems. The responses of the land to changes in use and management by people depend on expressions of these fundamental principles in nature" (p. 24). The authors also lament that ecosystem principles are seldom considered in land use decisions affecting private land, with cumulative, detrimental, long-term effects, difficult to reverse.

Daly, Erin Moore, and Robert Frodeman, "Separated at Birth, Signs of Rapprochement: Environmental Ethics and Space Exploration," Ethics and the Environment 13(no. 1, 2008):135-151. Although environmental philosophy and the human exploration of space share common beginnings, scholars from either field have not given adequate attention to the possible connections between them. In this essay, we seek to spur the rapprochement and cross-fertilization of philosophy and space policy by highlighting the

philosophic dimensions of space exploration, pulling together issues and authors that have had insufficient contact with one another. We do so by offering an account of three topics: planetary exploration, planetary protection and the search for extraterrestrial life, and terraforming. The resulting synthesis seeks to change our thinking about earthbound environmental ethics as it considers the philosophical dimensions of space exploration, and introduces the possible benefits of a humanities-oriented approach to space policy. Erin Moore Daly is a graduate student in the School of Life Sciences and the Center for Science, Policy, and Outcomes at Arizona State University. Robert Frodeman is chair of the Department of Philosophy at the University of North Texas.

Daly, Herman E., "Allocation, Distribution, and Scale: Towards an Economics that is Efficient, Just, and Sustainable," Ecological Economics 6(1992):185-193. The practical policy of issuing tradeable permits for depletion and pollution requires for its implementation the clear separation of the three basic economic goals of efficient allocation, equitable distribution, and sustainable scale. Economic theory needs to catch up with policy in recognizing that scale issues cannot be reduced to either allocation or distribution. Daly is at the School of Public Affairs, University of Maryland. (v8,#2)

Daly, Herman reviews David Ehrenfeld's Beginning Again: People and Nature in the New Millennium in Conservation Biology 7(1993):736-738. Among his observations: "The case for preserving biodiversity is based on an appeal to some combination of instrumental and intrinsic value. But biology also teaches that the whole show was a big accident and that all the differentiated parts, ourselves included, are little accidents, all produced by random mechanical causation with no purpose or final causation admitted. Is it possible, really, to love an accident? Is it possible to save what we cannot love? If biologists continue to insist that we must substitute the idea of 'Accident' for the idea of 'Creation,' then they really undercut their own pleas for the preservation of biodiversity beyond the most short-run instrumental arguments. If 'biophilia' is really genetically programmed into us, then why are we killing other species wholesale? This is not to deny the important role of chance and necessity, of evolution, in the practical working of Creation. But the assumption that the biologist's 'central dogma' is sufficient to require the substitution of Creation by Accident is past due for serious rethinking. ... I hope that biologists will not, in their

descriptions and explanations of the living world, abstract so completely from the immediate and universal experience of purpose that they are in the end left with no basis in their own science to support their pleas for political action to conserve biodiversity." Daly is an economist with the World Bank's environmental department. (v4,#4)

Daly, Herman E. and John B. Cobb, Jr., For the Common Good: Redirecting the Economy Toward Community, the Environment, and a Sustainable Future. Boston: Beacon Press, 1989, revised edition, 1994). Pp. viii, 482. A major criticism and restructuring of economic and political thinking regarding environmental policies. The book contains extensive recommendations for policy change. The central concern is the shift from an economics based on individual human demands to an economics based on social community. For the student of environmental philosophy, the key argument then focuses upon the definition or extent of community: is the biosphere and its natural entities part of the community for which sustainable and beneficial economic policies will be implemented? Daly and Cobb deny the possibility of the biosphere being a member of the community, but they permit humans to characterize their involvement in the biosphere as a membership in a larger community. This characterization creates a "biocentric vision" that can shape economic policy (pp. 202-03). (Katz, Bibl # 2)

Daly, Herman E. and John B. Cobb, Jr. For the Common Good: Redirecting the Economy toward Community, the Environment, and a Sustainable Future (Boston: Beacon Press, 1989, revised edition, 1994). This book, jointly authored by an economist and a theologian, was in manuscript the focus of several symposia, and is likely to prove a major contribution to the effort to achieve a sustainable, conservation oriented economy. Daly is now with the World Bank and Cobb is at Claremont School of Theology. (v1,#1)

Daly, Herman E. Beyond Growth: The Economics of Sustainable Development. Boston: Beacon Press, 1996. "Although there is an emerging political consensus on the desirability of something called sustainable development, this term--touted by many and even institutionalized in some places--is still dangerously vague. Apparent agreement masks a fight over what exactly 'sustainable development' should mean--a fight in which the stakes are high" (p. 1). Part I. Economic Theory and Sustainable Development. Part II. Operational Policy and Sustainable Development. Part III. National Accounts and Sustainable Development. Part IV. Population and Sustainable Development. Part V. International Trade and Sustainable Development. Part VI. Two Pioneers in the Economics of Sustainable Development (Frederick Soddy and Nicholas Georgescu-Rogers). Part VII. Ethics, Religion, and Sustainable Development (Biblical economics and the sustainable economy, and how to move from religious insight to ethical principle and public policy). Anything written by Herman Daly is worth reading by philosophers (as well as by economists and everybody else). Daly is in economics at the University of Maryland.

Anyone who doubts the clout of establishment economics should read Daly's note about the history of his manuscript. Solicited by MIT, it was accepted by MIT Press; five reviewers said publish it. But a distinguished economist on their advisory committee killed it, after a contract had been issued (p. 225). (v8,#1)

Daly, Herman E. "On Wilfred Beckerman's Critique of Sustainable Development." Environmental Values 4(1995):49-55. Beckerman's discussion of sustainable development (Environmental Values 3: 191-209) provides some useful clarifications, and a good occasion for making a few more. Since I advocate what he calls the 'sustainability as constraint' position, I will move straight to it..... Daly is in the School of Public Affairs, University of Maryland. (EV)

Damodaran, A., "The Project Tiger Crisis in India: Moving Away from the Policy and Economics of Selectivity," *Environmental Values* 16(2007): 61-77. This paper discusses the economic and philosophical inadequacies that have characterised the Project Tiger scheme in India. Launched in the 1970s to protect the habitats of the Royal Bengal Tiger, Project Tiger has over time evolved into a management system that has abstracted the tiger from its habitat by highlighting its charismatic functions. However the abstraction has also caused the tiger to be valued for its narrow consumptive uses. By comparison the habitats that have nurtured the tiger have received less attention. The paper critiques partial equilibrium frameworks that have attempted to value a tiger in terms of demand and supply functions rather than as an integral element of an ecosystem. While considering the superiority of the Total Economic Value concept as a value-determining method, the paper also points to the limitation of the concept in not addressing the conflicts between use and non-use values of a tiger. In the light of these facts, the paper advances the theory of complementarity as a valuation approach that considers the tiger and its habitat as a joint resource that needs to be protected and conserved in the larger interests of

biodiversity conservation in India. Damodaran is at the Indian Institute of Management, Bangalore.

Daniel, Pete, "Technology and Ethics in Agriculture", *Journal of Agricultural and Environmental Ethics* 6(1993). Using technological changes in wheat harvest, the formation and transformation of the cotton culture, the impact of the Green Revolution in Malaya, and genetic engineering as examples, this article explores the positive and negative impacts of science and technology applied to agriculture. The limited and considered use of science and technology by the Amish suggests an alternative to the uncritical adoption of capital-intensive farming methods that cause human displacement and ecological damage. Larger farm operations and the substitution of technological expertise for husbandry distances farmers from their land and crops and sometimes leaves an ethical void. Daniel is in the National Museum of American History, Washington, DC 20560.

Daniel, Terry C., "Whither Scenic Beauty? Visual Landscape Quality Assessment in the 21st Century," *Landscape and Urban Planning* 54(2001):276-281. A review of the history of efforts systematically to assess the quality of our visual landscape and an appraisal of the future of this scientific and practical enterprise. There is an ongoing tension between the judgments of experts in science and/or aesthetics and the perceptions of residents on landscapes. Emphasis on ecosystem management increasingly figures in landscape quality assessment, and some aspects of this are subject to technological assessment. At a deeper level, traditional landscape approaches are increasingly challenged by deep ecology and green philosophy, which advocate a strongly biocentric approach to land quality assessment. On the opposite side, social/cultural construction models so construe the landscape as the product of socially constructed human interpretation that these leave little or no role for biophysical landscape features and processes. Daniel proposes a psychological approach for more balance between biophysical and human perception/judgment components. Daniel is in psychology, School for Renewable Natural Resources, University of Arizona, Tucson. (v.13, #3)

Dantzer, Robert, "Research Perspectives in Farm Animal Welfare: The Concept of Stress", *Journal of Agricultural and Environmental Ethics* 6(1993), Supplement. Research carried out during the last two decades on hormone-behaviour relationships in stressful situations has allowed us to discard the simplistic

stimulus-response model of stress in favour of more sophisticated interactionist models which incorporate as intervening variables the psychological and social resources available to the individual (coping). It is now well-recognized that the response to stress is multidimensional, involving different responses in different systems, individuals, and situations. This complexity cannot be addressed by sticking to the old notion of stress as a non-specific response to every stimulus that threatens homeostasis. A more appropriate perspective is to view stress responses as modular. According to this perspective, the organism is equipped with a number of defence systems that are triggered by specific exteroceptive or interoceptive stimuli, and that lead to defence reactions which involve intricate relationships between physiological and behavioural responses. Although these different defence systems normally function independently from one another, they can also interact due to some commonality in their underlying neural mechanisms and as a result of competition for a final common behavioral pathway. The study of how information is processed within each system and how different systems interact with each other provides new insights about the pathophysiology of stress-related disorders, and may help us to understand how the concept of health, defined as a state of physiological and psychological well-being, can be translated into biological terms. Dantzer is at INRA-INSERM U176, Rue Camille Saint-Saens, 33077 Bordeaux Cedex, France.

Tabor, Carol House, and Mary C. Pearl, 2002. Conservation Medicine: Ecological Health in Practice. Oxford: Oxford University Press. Pathogens travel both ways, from wild animals to humans, producing pandemic diseases, and from humans to wild animals, disabling them with disease and in some cases threatening them with extinction. The authors also raise some interesting practical and ethical concerns about the extinction of parasites, with accompanying references. Daszak is with the Consortium for Conservation Medicine, Wildlife Trust, New York. Cunningham is in wildlife epidemiology, Zoological Society of London.

Daszak, Peter, Cunningham, Andrew A., and Hyatt, Alex D., "Emerging Infectious Diseases of Wildlife--Threats to Biodiversity and Human Health," Science 287(21 January 2000):443-449. Infectious diseases of wild animals spill over into domestic animals and vice versa. They also spill over into humans and vice versa. These diseases threaten biodiversity as well as human health. Increased populations escalate the problem. The Spanish conquistadors brought smallpox and measles into native American peoples; likewise their animals brought wildlife diseases. A classic misfortune, a paradigm for the future, is the African rinderpest epidemic of the 1880's and 1890's, introduced from Asia, and spreading across Africa in ten years, devastating cattle and wild buffalo. Daszak is with the Institute of Ecology, University of Georgia. (v.11,#4)

Daugherty, Steven A. "The Unfulfilled Promise of an End to Timber Dominance on the Tongass: Forest Service Implementation of the Tongass Timber Reform Act." Environmental Law 24 (no. 4, 1994): 1573- Ways that the U. S. Forest Service has failed to carry out the intent behind the Tongass Timber Reform Act; the U. S. Congress should enact further legislation that imposes clearer standards. (v6,#1)

Dauvergne, Peter. Shadows in the Forest: Japan and the Political Economy of Deforestation in Southeast Asia. Cambridge, MA: MIT Press, 1997. 336pp. \$45 cloth, \$22 paper. Dauvergne examines Japan's effect on commercial timber management in Indonesia, East Malaysia and the Philippines. The book is one of the first to examine the environmental impact of Northeast Asian development on Southeast Asian resource management and to analyze the indirect environmental impact of bilateral state relations on the management of South Asian forest resources. (v8,#1)

Dauvergne, Peter. Shadows in the Forest: Japan and the Politics of Timber in Southeast Asia. Cambridge, MA: MIT Press, 1997. 336 pp. \$22. Although Japanese practices have improved somewhat since the early 1990's, Dauvergne maintains that corporate trade structures and purchasing patterns, timber prices, wasteful consumption, import tariffs, and the cumulative environment effects of past practices continue to undermine sustainable forest management in Southeast Asia. Davidson, Julie. "Sustainable Development: Business as Usual or a New Way Of Living?" Environmental Ethics 22(2000):25-42. In the eighteenth century, the economic problem was reformulated according to a particular set of politico-economic components, in which the pursuit of individual freedom was elevated to an ethical and political ideal. Subsequent developments of this individualist philosophy together with the achievements of technological progress now appear as a threat to future existence. Extensive environmental degradation and persistent global inequalities of wealth demand a new reformulation of the economic problem. Sustainable development has emerged as the most recent economic strategy for addressing concerns about ecological integrity and social justice. Although there is a recognized continuum of understanding about the concept from conservative to radical it has been argued that only the radical version of sustainable development embodies the ethical capacity to address these concerns. Simultaneously the perennial existential question "How should we live?" has been raised anew along with the novel ethico-moral question: "How should we arrange our systems of production and consumption to ensure the sustainability of the Earth under conditions of conspicuous and pressing environmentally limiting conditions?" Moreover, the strong normative dimension embodied in the radical version of sustainability represents a challenge to liberal democracy and its understanding of individual and collective goods. I argue that the radical approach has the capacity to relieve what is an inherently acute tension of modern life and to reconcile individual autonomy with the wider social and ecological good. (EE)

Davidson, Marc D., "Wrongful Harm to Future Generations: The Case of Climate Change," *Environmental Values* 17(2008):471-488. I argue that governments are justified in addressing the potential for human induced climate damages on the basis of future generations' rights to bodily integrity and personal property. First, although future generations' entitlements to property originate in our present entitlements, the principle of self-ownership requires us to take 'reasonable care' of the products of future labour. Second, while Parfit's non-identity problem has as yet no satisfactory solution, the present absence of an equilibrium between theory and intuitions justifies a precautionary approach, i.e. treating climate damage as a wrongful harm. In addition, a supplementary consideration is described as arising from transcendental needs.

Davidson, Stewart, "The Troubled Marriage of Deep Ecology and Bioregionalism," *Environmental Values* 16(2007): 313-332. Bioregionalism is often presented as the politics of deep ecology, or deep ecology's social philosophy. That the ties uniting these doctrines are rarely explored can be put down to a perception amongst commentators that such links are self-evident and therefore unworthy of closer examination. By arguing that the bonds between deep ecology and bioregionalism are more tenuous than has often been assumed, this paper addresses this theoretical lacuna. There is nothing exclusive to the central tenets of deep ecology which provides us with a coherent rationale for a specifically bioregional form of decentralisation. However, deep ecology has nonetheless had an appreciable impact on bioregional thinking. In this context it is argued that bioregionalism's assimilation of aspects of deep ecology, and particularly an emphasis upon cross-species identification, undermines the project in various ways. Davidson is in the Department of Government, University of Strathclyde, Glasgow, Scotland.

Davies, Anna. "What Silence Knows - Planning, Public Participation and Environmental Values," *Environmental Values* 10(2001):77-182. While fraught with ambiguities, support for greater public participation in environmental policy making is experiencing a renaissance amongst sections of government and academia, particularly within the field of land-use planning. There is concern within this cohort that the planning system silences public voices through its current mechanisms for community involvement. Proponents of participation often presuppose that more public participation will produce both 'better' decisions and environmental benefits, but to date research has focused on the front-end, or "processes", of participation rather than the "products" that result. While procedural aspects of public participation are important it is imperative that critical consideration is also given to what emerges from the participation that is being exalted. This paper addresses this concern by focusing on the products of a public participation exercise conducted in Luton, South-east England in order to consider what it is that "silence knows". Keywords: Environmental values, public participation, land-use planning, Luton. Davies is in the Department of Geography, King's College, London. (EV)

Any incentives will have to be woven into regulatory law. (v8,#1)

Davion, Victoria, "Anthropocentrism, Artificial Intelligence, and Moral Network Theory: An Ecofeminist Perspective," Environmental Values 11(2002): 163-176. This paper critiques a conception of intelligence central in AI, and a related concept of reason central in moral philosophy, from an ecological feminist perspective. I argue that ecofeminist critique of human/nature dualisms offers insight into the durability of both problematic conceptions, and into the direction of research programmes. I conclude by arguing for the importance of keeping political analysis in the forefront of science and environmental ethics. (EV)

Davion, Victoria. "Itch Scratching, Patio Building, and Pesky Flies: Biocentric Individualism Revisited." Environmental Ethics 28(2006):115-128. Biocentric individualism, the position that all life has intrinsic value, is of no practical help in policy-making contexts. Examples commonly used in discussions of biocentric individualism are themselves alienating and threaten to make environmental philosophy appear irrelevant to policy decisions. Hence, both biocentric individualism and typical discussions of it are problematic for those wishing to make environmental philosophy useful in policy. A recent article by Jason Kawall, in which he attempts to defend biocentric individualism, demonstrates these points. (EE)

Davion, Victoria. "Theoretical Versus Applied Ethics: A Look at Cyborgs," Ethics and the Environment 4(1999):73-78. In this brief comment I will focus on Chris Cuomo's (1998) discussions of theoretical versus applied ethics, and apply this discussion to her suggestion that the cyborg myth as discussed by Donna Haraway, can be a helpful ecological feminist ideal. Although I agree with Cuomo that some aspects of the cyborg myth might be helpful, I will explore some disturbing aspects of cyborgs. Cuomo is certainly aware of the dangers of the cyborg myth, mentioning many of them herself. My aim is to fill out a discussion of such dangers by arguing that cyborgs are nothing new. In fact, I shall argue that key figures involved in the decision to bomb Hiroshima and Nagasaki, including President Truman, identified with the bomb and bomb-centered technology in a cyborgian manner. Obviously, the kind of cyborg identity that could encourage mass murder of the sort involved in our bombings of Japan, and the cyborg ideal that inspires Cuomo are very different. However, Cuomo's discussion of theoretical versus applied ethics clearly indicates that before ecological feminists accept the cyborg as a theoretical ideal, we should examine how real cyborgs, if there have in fact been any, have functioned within society. Hence, if the case can be made that those responsible for the devastating bombings of Japan were cyborgs, this fact is crucial for anyone promoting a cyborg ideal of any sort to consider. Davion is in philosophy at the University of Georgia. (E&E)

Davis, Mackenzie L., and Cornwell, David A., Introduction to Environmental Engineering. Boston: McGraw-Hill, 1998. 919 pages. A major introductory text to environmental engineering, with, early on, a small section on environmental ethics. "The birth of environmental ethics as a force is partly a result of concern for our own long-term survival, as well as our realization that humans are but one form of life, and that we share our earth with other forms of life. ... The acceptable system is one in which we learn to share our exhaustible resources--to regain a balance. This requires that we reduce our needs and that the materials we use must be replenishable. We must treat all of the earth as a sacred trust to be used so that its content is neither diminished nor permanently changed; we must release no substances that cannot be reincorporated without damage to the natural system. The recognition of the need for such adaptation (as a means of survival) has developed into what we now call the environmental ethic" (pp. 33-35). Davradow, Maria and Namkoong, Gene, "Science, Ethical Arguments, and Management in the Preservation of Land for Grizzly Bear Conservation," Conservation Biology 15 (no. 3, June, 2001):570-577. Environmental groups advocate the preservation of an area within British Columbia's coastal

temperate rainforest as a sanctuary for grizzly bears (*Ursus arctos horribilis*). Debate among government, industry, and environmental spokespersons has provided arguments but no resolution. We have applied to this issue available biological knowledge on grizzly bears and the arguments of a range of ethical theories. The theories of three professionally trained ethicists were included: Tom Regan, Holmes Rolston III, and Arne Naess. Aldo Leopold's prominent position in the conservation movement justifies his "land ethic" as a fourth ethical theory. All four theories agree that the area should be preserved. Contrary to this fundamental agreement, the theories diverge when tested against a "hard" conservation scenario, the conflict between the protection of the last surviving grizzly bears versus the survival of a culturally distinct human tribe. Application of the principles developed by Regan and Naess recommend that human interests should override the preservation of grizzly bears, whereas Leopold's and Rolston's arguments favor the preservation of the area for the bears. Our work can be used as a model of how the gap between biological sciences, ethical theories, and ecosystem management can be bridged successfully. The authors are in Forest Sciences, University of British Columbia. (v.12,#4)

Davradou, Maria and Paul Wood. "The Promotion of Individual Autonomy in Environmental Ethics." Environmental Ethics 22(2000):73-84. In his book The Morality of Freedom, Joseph Raz argues that the promotion of personal autonomy can serve as a constitutive principle for a comprehensive political theory. He maintains that three conditions are necessary for attainment of individual autonomy: appropriate mental abilities, an adequate range of options, and independence. In this essay, by focusing on Raz's conception of an adequate range of options, we suggest that Raz's theory justifies environmental conservation in general. We present an empirical framework of present-day assaults on personal autonomy, construct a heuristic scenario, and argue against both neoclassical economics and utility maximization as adequate criteria regarding environmental decisions. We conclude that successful environmental policies should directly or indirectly strive to provide the conditions necessary for promoting individual autonomy. (EE)

Davy, Barbara Jane, "An Other Face of Ethics in Levinas," *Ethics and the Environment* 12(no. 1, 2007):39-65. The main threads of Emmanuel Levinas' theory of ethics, developed in his philosophical works, *Totality and Infinity* (1969), and *Otherwise than Being or Beyond Essence* (1998), instruct that ethics require transcendence of being and nature, which he describes in terms of a transcendence of animality to the human. This apparent devaluation of the nonhuman would seem to preclude the development of Levinasian environmental ethics. However, a deconstructive reading of Levinas recognizes a subtext that interrupts the main thread of his argument running against the inclusion of nonhuman others in ethics. Through a critical reconstructive reading of Levinas, I develop an ethic extraneous to Levinas' transcendent ethics, an ethic outside his *Otherwise than being*.

Dawkins, Marian Stamp, "From an Animal's Point of View: Motivation, Fitness, and Animal Welfare," Behavioral and Brain Sciences 13(1990):1-61. To study animal welfare empirically we need an objective basis for deciding when an animal is suffering. Suffering includes a wide range of unpleasant emotional states such as fear, boredom, pain, and hunger. Suffering has evolved as a mechanism for avoiding sources of danger and threats to fitness. Captive animals often suffer in situations in which they are prevented from doing something that they are highly motivated to do. In designing environments for animals in zoos, farms, and laboratories, priority should be given to features for which an animal

continues to work despite increasing costs. The care of animals can thereby be based on an objective, animal-centered assessment of their needs. A "target" article, with commentary by two dozen critics, most eminently Peter Singer. Dawkins is at Oxford University in the department of zoology.

Dawkins, Richard, "Sustainability Doesn't Come Naturally: A Darwinian Perspective on Values." Inaugural Lecture, The Values Platform for Sustainability, The Environment Foundation. Online at: <www.environmentfoundation.net/richard-dawkins.htm>. The Environment Foundation is a UK charitable organization that seeks to put sustainability on the business agenda, here inaugurating a program coupling business values and biological values. Dawkins gave the inaugural address, also with a question and answer session, 14 November, 2001.

"'What comes naturally' is a topic which Darwinism might be expected to illuminate. Darwinian natural selection gives us just about everything else in our nature--our bones, our organs, our instincts. If there is a reason to exclude our values, it had better be a good one. The values of sustainability are important to all of us here and I enthusiastically include myself. We might therefore hope that these too are built into us by natural selection. I shall tell you today that this is not so. On the contrary, there is something profoundly anti-Darwinian about the very idea of sustainability. But this is not as pessimistic as it sounds. Although we are products of Darwinism, we are not slaves to it. Using the large brains that Darwinian natural selection has given us, it is possible to fashion new values that contradict Darwinian values and that is the policy I shall urge upon you" (opening paragraph).

Dawkins claims that we are biologically inclined to pursue short-term self interest, but that our minds can override that with long-term self interest, but still self interest. "From a Darwinian point of view, the problem with sustainability is this: sustainability is all about long-term benefits of the world or of the ecosystem at the expense of short-term benefits. Darwinism encourages precisely the opposite values. Short-term genetic benefit is all that matters in a Darwinian world." "There is a tension between short-term individual welfare and long-term group welfare or world welfare. If it were left to Darwinism along there would be no hope. Short-term greed is bound to win. The only hope lies in the unique human capacity to use our big brains with our massive communal database and our forward simulating imagination." "The answer lies in the fact that brains, although they are the products of natural selection, follow their own rules, which are different from the rules of natural selection."

Can we get past long-term self interest, perhaps to justice, equity, or respect for nature? Dawkins is doubtful but hopeful. In answer to a question by Kate Rawles, an environmental philosopher: "I suppose maybe you were asking because of the hope that one might be able to teach people to forgo short-term selfish gain in the interest of long-term world benefit. I am more optimistic about that. There are an awful lot of people who, either for cultural reasons or educational reasons or I don't know quite what, do seem to be capable of subjugating their selfish desires for the good of humanity as a whole, or even living creatures as a whole. The fact that some people seem to manage to do this gives me hope that more people might." And, continuing, "I suppose I ought to say that, as a passionate Darwinian in the academic sense that I believe Darwinism is the explanation for all of life, I am also a passionate anti-Darwinian when it comes to deriving values for our own life. A pretty good definition of the kind of society in which I don't want to live is a society founded on the principles of Darwinism. That is, in a way, the central message of my lecture." Dawkins is professor of the public understanding of science, Oxford University, and author of The Selfish Gene. (v.13,#1)

Dawkins, Richard, "The Evolved Imagination: Animals as Models of Their World," Natural History 104 (no. 9, September, 1995):8, 10-11, 22-24. "An animal is a model. Any organism is a model of the world in which it lives. ... Imagine a zoologist presented with the body of an animal she has never seen before. ... A good zoologist should be able to reconstruct almost everything about the world in which the animal lived." Some animals seem to have the capacity to model their worlds and project this model into the future. Thinking simulates the future, and humans are especially good at this. "And once natural selection had built brains capable of simulating slight departures from reality into the imagined future, a further capacity automatically flowered. Now it was but a short step to the wilder reaches of imagination

revealed in dreams and in art, an escape from mundane reality that has no obvious limits." (v9,#2)

Dawkins, Richard, *The God Delusion*. Reviewed by Amitrajeet A. Batabyal. *Journal of Agricultural and Environmental Ethics* 20(2007):221-223.

Dawkins, Richard, Unweaving the Rainbow: Science, Delusion, and the Appetite for Wonder. London: Penguin Books, 1998. Some fear that science empties nature of its beauty and wonder. Dawkins argues that science often finds solutions after which there remains the possibility of wonder, indeed science can increase the sense of wonder, and this can inspire further poetry.

de Laplante, Kevin. "Environmental Alchemy: How to Turn Ecological Science into Ecological Philosophy." Environmental Ethics 26(2004):361-380. Ecological science has been viewed by some philosophers as a foundational resource for the development of metaphysical, epistemological and

normative views concerning humanity's relationship with the natural environment, or what might be called an "ecological philosophy." Analysis of three attempts to infer philosophical conclusions from ecological science shows that (1) there are serious obstacles facing any attempt to derive unique philosophical consequences from ecological science and (2) the project of developing an ecological philosophy relevant to human-environment relations is seriously hindered by a reliance on traditional ecological science that focuses on relations between nonhuman organisms and their environments. However, the search for an ecological philosophy is not inherently misguided because (1) although ecological science may never support a unique philosophical interpretation of ecological theory, empirical evidence can function to narrow the range of possible interpretations, which is a significant epistemic achievement; and because (2) there are several non-traditional branches of ecological science that focus on human-environment relations and that consequently may be better suited to function as conceptual resources for the sorts of problems that concern environmental philosophers. DeBakker (De Bakker), Erik, "Integrity and Cynicism: Possibilities and Constraints of Moral Communication," *Journal of Agricultural and Environmental Ethics* 20(2007):119-136. Paying thorough attention to cynical action and integrity could result in a less naive approach to ethics and moral communication. This article discusses the issues of integrity and cynicism on a theoretical and on a more practical level. The first part confronts Habermas's approach of communicative action with Sloterdijk's concept of cynical reason. In the second part, the focus will be on the constraints and possibilities of moral communication within a business context. Discussing the corporate integrity approach of Kaptein and Wempe will provide this focus. Their approach can be considered as a valuable contribution to the question of how to deal with (dilemmas of) conflicting interests, open discussion, fairness, and strategic decision-making in the context of stakeholder dialog. However, it is concluded that Kaptein and Wempe seem to overstretch the concept of corporate integrity by their inclination to make it an all-purpose remedy for corporate dilemmas. Keywords: Business ethics - communicative/strategic action - cynicism - integrity - moral communication - open/hidden agendas - social theory. Bakker is at LEI (Agricultural Economics Research Institute), Public Issues Division, Wageningen UR, The Hague, The Netherlands.

Deblonde (DeBlonde), Marian K. "Environmental Economics: The Meaning of an 'Objective' Policy Science." Environmental Values 9(2000):235-248.

Abstract: Environmental economics is a policy science. Environmental economists, however, find that their policy recommendations are often neglected by political officials. Some of them react to this neglect by reproaching public authorities with lack of efficiency: this so-called inefficiency is considered to be a manifestation of government failure. Others propose a redefinition of environmental economics in order to make it fit better with actual political objectives. After briefly outlining the case for an economic paradigm that differs from conventional (i.e. neo-classical welfare) environmental economics, I argue that an alternative paradigm demands a different interpretation of economic 'objectivity'. I claim that economic 'objectivity' ultimately comes down to a non-neutral common consent within a particular community of economic scientists. This interpretation leaves room for a multiplicity of 'objective', but non-neutral economic theories. The fact that the inevitable value ideas underlying a particular theory cannot be made fully transparent, urges us to accept a different conception of the theory's political relevance. Environmental economic theory should be considered not so much a provider of political 'instruments', as of scientific 'insights'. It should not simply be considered a theory that responds to actual political objectives, but one that inspires political objectives. These two latter suggestions of mine are only preliminary recommendations, which require further conceptual analysis. Keywords: Bromley, neutrality, objectivity, Pearce. Marian K. DeBlonde is in Applied Philosophy, Wageningen Agricultural University, Hollandseweg 1, 6706 KN Wageningen, The Netherlands. (EV)

Deblonde, M., R. de Graaff, and F. Brom, "An Ethical Toolkit for Food Companies: Reflections on its Use," *Journal of Agricultural and Environmental Ethics* 20(2007):99-118. Nowadays many debates are going on that relate to the agricultural and food sector. It looks as if present technological and organizational developments within the agricultural and food sector are badly geared to societal needs and expectations. In this article we briefly present a toolkit for moral communication within the food chain. This toolkit is developed as part of a European research project. Next, we discuss what such a toolkit can bring about, given the characteristics of the present day agricultural and food sector and its wider context. We defend that the toolkit can be seen as one of the mechanisms that can help enterprises in the agricultural and food sector to be accountable. It should, however, be complemented with other mechanisms, first, to empower the wider public and, second, to stimulate a dialogue, on a more equal footing, between public authorities, citizens, and economic act. Keywords: CSR (developed form) - empowerment - ethical toolkit - equal dialogue - food sector - moral communication. Deblonde is at Department Environment, Technology & Technology Management, Research Centre for Technology, Energy and Environment — STEM, University of Antwerpen, Antwerp, Belgium.

Deblonde, Marian and Patrick Du Jardin, "Deepening a Precautionary European Policy," Journal of Agricultural and Environmental Ethics 18(2005):319-343. The principle of precaution is hardly linked to the ideal of sustainable development. It should be. Sustainable development is the sense of an ethics of co-responsibility, while precaution is the attitude needed to realize this sense. We comment on some regulatory practices within the European context regarding authorization requests for deliberate releases of genetically modified crops and show some problems that are popping up there, for example, the difficulties in interpreting the meaning of harm and of benefit. Deckers, Jan, "Christianity and Ecological Ethics: The Significance of Process Thought and a Panexperientialist Critique of Strong Anthropocentrism," Ecotheology 9(no. 3, 2004):359-387. In recent years, Christian theologians have reconsidered our duties towards nonhuman entities by rethinking the God-humanity relationship. The way in which nonhuman nature is conceived has largely remained unchanged. The key to the development of an adequate ecological ethic lies in the casting aside of materialist and dualist conceptions of matter, and the adoption of panexperientialism. Weak speciesism is the required ethic. It places humans first, yet assigns great significance to other animals. It commits many humans to quasi-veganism. Deckers is Lecturer in Health Care Ethics, School of Population and Health Sciences, The Medical School, University of Newcastle, UK.

Deckers, Jan, "Are Scientists Right and Non-Scientists Wrong? Reflections on Discussions of GM," Journal of Agricultural and Environmental Ethics 18(2005):451-478. While many people have been reported to hold the view that GM is unnatural, many policy-makers and their advisors have suggested that the view must be ignored or rejected, and that there are scientific reasons for doing so. Their accounts fail to mount a convincing critique. In an empirical research project at the University of Newcastle-upon-Tyne, scientists met with non-scientists in a range of facilitated one-to-one conversations (exchanges) on various environmental issues, one of which was on GM. Our findings show that some scientists who rejected the GM is unnatural view struggled to do so consistently. The concerns of those who held the GM is unnatural view rejected the instrumentalization of the nonhuman world. Because the underlying concerns of those who held the GM is unnatural view were not with GM as such, yet with a worldview that was considered to be problematic, policy-makers and their advisors should reflect on the critical worldview of those who claim that GM is unnatural if they want to engage seriously with their concerns. Keywords: biotechnology - deliberative exchange - policy - science - unnatural - worldviews. Deckers is in the School of Population and Health Sciences, University of Newcastle, UK. (JAEE)

Deckha, Maneesha, "Disturbing Images: Peta and the Feminist Ethics of Animal Advocacy," Ethics and the Environment 13(no. 2, 2008):35-76. The author applies a feminist analysis to animal advocacy initiatives in which gendered and racialized representations of female sexuality are paramount. Feminists

have criticized animal advocates for opposing the oppression of nonhuman animals through media images that perpetuate female objectification. These critiques are considered through a close examination of two prominent campaigns by PETA (People for the Ethical Treatment of Animals). The author argues that some representations of female sexuality may align with a posthumanist feminist ethic and need not be read as sexist. Examining PETA's famous anti-fur ads and the more recent Milk Gone Wild campaign, the author identifies where PETA's campaigns are objectionable under a feminist ethic and where they are subversive of an anthropocentric and male-dominated order alike. The article thus recuperates part of PETA's work from feminist critiques, but also reveals the constructions posthumanist advocacy should exclude to avoid elevating the status of nonhuman animals at the expense of women. Maneesha Deckha is an Associate Professor at the University of Victoria Faculty of Law

DeCosse, David E. "Beyond Law and Economics: Theological Ethics and the Regulatory Takings Debate", Boston College Environmental Affairs Law Review 23(no.4,1996):829. (v7,#4)

deDube (de Duve), Christian, Vital Dust: The Origin and Evolution of Life on Earth. New York: Basic Books, 1995. de Duve is a Nobel Prizewinner for discoveries about the functional and structural organization of the cell. This is his philosophical overview: "Life is almost bound to arise in a molecular form not very different from its form on Earth. ... Those who claim that life is a highly improbable event, possibly unique, have not looked closely enough at the chemical realities underlying the origin of life." The stuff of the earth is "vital dust" (p. 292). Of interest to environmental philosopher is a concluding section on "The Future of Life." Life on Earth, a cosmic imperative over the millennia, has recently come under the most serious threat ever, human overpopulation and consumptive appetites degrading the Earth. Science needs more wisdom. "The last twenty years have witnessed a remarkable rise in global responsibility. The ecological movement, in spite of excesses, deserves to be praised" (p. 283). Now emeritus, de Duve taught at the University of Louvain, Belgium, and Rockefeller University, New York. (v7,#4)

Deegan, Mary Jo and Christopher W. Podesch. "The Ecofeminist Pragmatism of Charlotte Perkins Gilman." Environmental Ethics 23(2001):19-36. We read the roots of contemporary ecofeminism through the lens of feminist pragmatism. After indicating the general relation between ecofeminism and feminist pragmatism, we provide a detailed analysis of Charlotte Perkins Gilman's saga *Herland* and *With Her in Ourland* to document the strong connection between these two traditions. Gilman's congruencies with ecofeminism make clear that she was a forerunner and perhaps a foundation for contemporary ecofeminism. However, further analyses are needed to reveal the full import of this link between ecofeminism and "ecofeminist pragmatism," as well as bridge the gap between ecofeminist pragmatism and ecopragmatism, including environmental pragmatism. Deffenbaugh, Daniel G., "Toward Thinking Like a Mountain: The Evolution of an Ecological Conscience," Soundings 78(1995):239-261. There is underway an evolution of the ecological conscience, a progressive movement away from thinking like self-interested human beings and toward thinking like a mountain. A review of the history of philosophical reflection in the West reveals why environmental ethics has been regarded as problematic. Very simply, we have inherited a tradition which has been developed from the perspective of egoism. If the human individual is the locus for discerning all value in the world, then ethics will naturally tend to serve those who are doing the valuing. In this case environmental ethics becomes a convenient tool for protecting human interests. A truly holistic environmental ethic involves a conceptual transition from egoism to ecoism, a move that is best facilitated

by an understanding of the ecological sciences. The significant contribution of Aldo Leopold and Holmes Rolston III has been the fundamental realization that nature and not culture should have the last word as to prescriptive duties. Deffenbaugh teaches in the Department of Religious Studies at the University of Tennessee. (v.10,#1)

DeGeus (De Geus), Marius, "Ecotopia, Sustainability and Vision", Organization and Environment, 15, (No. 2, 2002): 187-201. This article explores whether ecological utopias are capable of providing a useful contribution to our quest for an ecologically responsible future and a sustainable society and, if so, in what specific ways. The author develops a model of ecological utopias as a distant point of orientation, or as a "navigational compass". In this model ecotopias may influence the course of concrete decision making in the direction of a future sustainable society. After an analysis of the current social debate in western Europe on sustainable development, it is argued that ecological utopias can help us to "monitor" environmental problems and that they provide "inspiration" for a cleaner society. Ecotopias also allow us to imagine a "virtual reality" of a possibly ecologically stable society and are a justifiable means of visionary imagery of a better future. DeGreef (De Greef), Karel, Frans Stafleu and Carolien De Lauwere, "A Simple Value-Distinction Approach Aids Transparency in Farm Animal Welfare Debate," Journal of Agricultural and Environmental Ethics 19(2006):57-66. Public debate on acceptable farm animal husbandry suffers from a confusion of tongues. To clarify positions of various stakeholder groups in their joint search for acceptable solutions, the concept of animal welfare was split up into three notions: no suffering, respect for intrinsic value, and non-appalling appearance of animals. This strategy was based on the hypothesis that multi-stakeholder solutions should be based on shared values rather than on compromises. The usefulness of such an artificial value distinction strategy was tested in a small series of experiments. The results demonstrate that the chosen concept to distinguish between values is effective in a stakeholder context. Farmers' views on doing good to animals appeared to be largely based on their value to prevent suffering and predominantly focused on the provision of regular care. Their priority for this value is clearly shared with other stakeholders, providing a basis for joint solutions. The concept of intrinsic value does not play a discernable role in farmers' considerations. Based on the varying views on welfare, it can be inferred that there is a gradual rather than a principal difference between government legislation and farmers' values, whereas public perception and acceptance of farm practices remains complicated. Distinction between value groups and focusing on a selected notion (such as no suffering) proved to be effective in bringing representatives of stakeholder groups together, but is unlikely to bridge the emotional gap between commercial farm practices and public ideals. Keywords: Animal welfare-farmer ethics-interactive design-intrinsic value-stakeholder views. De Greef is with the Animal Sciences Group of Wageningen UR, The Netherlands. Stafleu is with the Ethics Institute, Utrecht University, The Netherlands. De Lauwere is at the Agricultural Economics Research Institute, Wageningen UR, The Hague, The Netherlands.

Lund, Vonne, and I. Anna S. Olsson, "Animal Agriculture: Symbiosis, Culture, or Ethical Conflict?" Journal of Agricultural and Environmental Ethics 19(2006):47-56. Several writers on animal ethics defend the abolition of most or all animal agriculture, which they consider an unethical exploitation of sentient non-human animals. However, animal agriculture can also be seen as a co-evolution over thousands of years, that has affected biology and behavior on the one hand, and quality of life of humans and domestic animals on the other. Furthermore, animals are important in sustainable agriculture. They can increase efficiency by their ability to transform materials unsuitable for human consumption and by grazing areas that would be difficult to harvest otherwise. Grazing of natural pastures is essential for the pastoral landscape, an important habitat for wild flora and fauna and much valued by humans for its aesthetic value. Thus it seems that the environment gains substantially when animals are included in sustainable agricultural systems. But what about the animals themselves? Objections against animal agriculture often refer to the disrespect for animals' lives, integrity, and welfare in present intensive animal production systems. Of the three issues at stake, neither integrity nor animal welfare need in principle be violated in carefully designed animal husbandry systems. The main ethical conflict seems to lie in the killing of animals, which is inevitable if the system is to deliver animal products. We present the benefits and costs to humans and animals of including animals in sustainable agriculture, and discuss how to address some of the ethical issues involved. Keywords: animal welfare-ethics - killing - sustainability - vegetarianism. The authors are with the National Veterinary Institute, Oslo, Norway.

Dejong (De Jong), Mechtild, and Chunglin Kwa. "Ecological Theories and Dutch Nature Conservation," Biodiversity and Conservation 9(no. 8, 2000):1171-1186. Abstract. This paper aims to achieve insight into various ecological theories in the Netherlands which have different, and sometimes opposing, views on the conservation of nature. Interviews, publications and archival research brought to light four separate theories: "vitalistic/holistic", "dynamic", "cybernetic" and "chaos". Diversity is reached through stability according to vitalistic/holistic and cybernetic theories, but through change and instability according to the "dynamic" and "chaos" theories. These two groups are working apart, and continue to have their own ideas. Prediction of the future is only possible with the "vitalistic/holistic" and "cybernetic" theories. Ecologists who adhere to these theories feel responsible and able in different ways to change ecological nature towards desirable end goals. The other two theories, "dynamic" and "chaos", appear to be less activist. Key words: biodiversity, chaos theory, cybernetic theory, dynamic theory, economy, holistic theory, Rio de Janeiro, Second Law of Thermodynamics, signifies.

deJonge (de Jonge), Eccy, Spinoza and Deep Ecology: Challenging Traditional Approaches to Environmentalism. Aldershot: Ashgate, 2004. Reviewed by Alison Stone in Environmental Values 14(2005):524-527.

DeJonge, Eccy, Spinoza and Deep Ecology: Challenging Traditional Approaches to Environmentalism. Aldershot, Hants. UK: Ashgate Publishing Ltd., 2004. Explores deep ecology and the way Spinoza's philosophy has been put to this aim. Only a self-realization, along the lines of Spinoza's philosophy, can afford a philosophy of care which is inclusive of humans and the non-human world, which recognizes the need for civil laws and democratic policies for human flourishing. Claiming that "deep ecology is a muddled polemic" (p. 145), de Jonge criticizes existing versions of deep ecology, especially in that they fail to accept that human concerns are integral to environmental issues. Originally a Ph.D. thesis.

Del Caro, Adrian. "Nietzschean Considerations on Environment." Environmental Ethics 26(2004):307-321. The superhuman (Übermensch) is a human being attuned to his or her environment in such a way that human and environment function as a whole, in keeping with Zarathustra's prophecy that the superhuman is the meaning of the Earth. Nietzsche's rhetorical embrace of the Earth in *Thus Spoke Zarathustra* is actually grounded in the works of the 1870s, in particular *Human, All Too Human*, which does not receive its due in critical engagement but which requires serious critical revisitation if the ecological Nietzsche is to be heard above his own rhetoric. When Nietzsche's writings are considered from the standpoint of ecology, it emerges that the phrase "the superhuman shall be the meaning of the Earth" is not so much focused on a debatable vision of future humanity, but instead addresses strategies for inhabiting our finite Earth in a spirit of creativity, partnership, and meaningful daily interaction. The hotly debated doctrine of will to power, for example, undergoes clarification and grounding when subjected to ecological standards, resulting in a will to empowerment whose beneficiaries are not only humans who assume proper stewardship of the Earth, but all Earthly life forms insofar as the meaning of Earth must include them. Delancey, Craig. "Teleofunctions and Oncomice: The Case for Revising Varner's Value Theory." Environmental Ethics 26(2004):171-188. The view that organisms deserve moral respect because they have their own purposes is often grounded in a specification of the biological functions that the organism has. One way to identify such functions, adopted by Gary Varner, is to determine the etiology of some behavior based on the evolution of the structures enabling it. This view suffers from some unacceptable problems, including that some organisms with profound defects will by definition have a welfare interest in their defects. For example, this view entails that the patented oncomice, intentionally engineered and bred for a genetic defect that leads to extremely high incidence of cancer, would have a welfare interest in the development of tumors. The systems-based theory of biological functions, which refers not to the evolution of structures but rather to their role in the organism, escapes these problems, and shows how a theory of an organism's welfare interest in its purposes can be grounded in a sound naturalistic approach. This approach also has some fruitful corollaries, including an elegant theory of why species may require special moral regard. (EE)

deLaplante (de Laplante), Kevin, Toward a General Philosophy of Ecology, Ph. D. dissertation, Department of Philosophy, University of Western Ontario, 1998. Examines the role that ecological concepts and theories play in environmental philosophy and defends a conception of ecological science that is broad enough to address the philosophical and scientific concerns of environmental philosophers. These aims are consistent with the dominant tradition in contemporary environmental philosophy, but the argument is highly critical of the way the ecology-environmental philosophy relationship is conceived in contemporary environmental philosophy. Rather than view ecology as a conceptual and scientific resource that is relevant to environmental philosophy only insofar as it provides support for the ethical, social and political aims of environmentalism, deLaplante argues that the core problems of environmental philosophy are essentially problems for a general science and philosophy of ecology. The thesis defends the robustness of a conception of ecology that is sufficiently broad to encompass "ecological psychology", "ecological economics", and "ecological anthropology", as well as traditional ecological science.

Part One is a survey and critique of the role of ecology in environmental philosophy. Part Two develops a conceptual framework for a general philosophy of ecology based on developments in complex systems approaches in theoretical ecology and ecological psychology. Part Three explores in greater detail certain issues in the foundations of the relevant complex systems sciences. The supervisor was Kathleen Okruhlik. Kevin de Laplante is now teaching at Iowa State University, Ames. (v10,#4)

deLeeuw (de Leeuw), A. Dionys, "Contemplating the Interests of Fish: The Angler's Challenge" Environmental Ethics 18(1996):373-390. I examine the morality of sport fishing by focusing on the respect that anglers show for the interests of fish compared to the respect that hunters show for their game. Angling is a form of hunting because of the strong link between these two activities in literature, in management, and in the individual's participation in both angling and hunting, and in the similarity of both activities during the process of pursuing an animal in order to control it. Fish are similar in many ways to animals that are hunted, including their interests in survival and in avoiding pain. These interests need to be considered by anglers for moral reasons. All hunters and anglers value their sport with animals

more than they respect the lives of animals they pursue. Hunters are, therefore, similar to anglers in the respect that they show for the survival interests of their game animals. Hunters, however, are significantly different from anglers in the respect that they show for an animal's interest in avoiding pain and suffering. While hunters make every effort to reduce pain and suffering in their game animals, anglers purposefully inflict these conditions on fish. These similarities and differences have three important consequences. (1) The moral argument justifying the killing of animals for sport in hunting must apply to all of angling as well. (2) Angling, unlike hunting, requires a second justification for the intentional infliction of avoidable pain and suffering in fish. (3) If ethical hunters hold true to their principle of avoiding all suffering in animal that they pursue, then hunters must reject all sports fishing. de Leeuw is a biologist with the British Columbia Ministry of Environment, Lands, and Parks. Williams directs an institute for applied ethics, and teaches philosophy at Saint Thomas University, Fredericton, New Brunswick. (EE)

Delgado, Ana, "Opening Up for Participation in Agro-Biodiversity Conservation: The Expert-Lay Interplay in a Brazilian Social Movement," *Journal of Agricultural and Environmental Ethics* 21(2008):559-577. In science and environmental studies, there is a general concern for the democratization of the expert-lay interplay. However, the democratization of expertise does not necessarily lead to more sustainable decisions. If citizens do not take the sustainable choice, what should experts and decision makers do? Should the expert-lay interplay be dissolved? In thinking about how to shape the expert-lay interplay in a better way in agro-biodiversity conservation, I take the case of the MST (Movimento Sem Terra/Landless People's Movement), possibly the largest rural movement in Latin America. The MST is in a process of turning towards environmentalism. It has adopted agroecology, a democratically oriented knowledge field. However, not all of the farmers were willing to adopt new environmentalist ideas and practices. Through ethnographic research, I analyze how expertise was recognized and redistributed within the MST, attending particularly to the role of MST coordinators and technicians. I explore how participation was framed and put into action. The adoption of agroecology brought to the MST a new and more inclusive map of expertise, but it also influenced new social distinctions within the communities. In part, farmers' knowledge was labeled as ignorance. This may close down possibilities for dialogue as well as for sustainability. The paper suggests that experts' power for discriminating among lay knowledges should come together with a responsibility for opening spaces for dialogue and action. One way of doing so could be by adding "interactional reflexivity" to experts' expertise. Delgado is in the Institute of Environmental Science and Technology, Autonomous University of Barcelona, Barcelona, Spain, also with the Centre for the Study of the Sciences and the Humanities, University of Bergen, Bergen, Norway.

Delind, Laura B., "Of Bodies, Place, and Culture: Re-Situating Local Food." *Journal of Agricultural and Environmental Ethics* 19(2006):121-146. In the US, an increasingly popular local food movement is propelled along by structural arguments that highlight the inequity and unsustainability of the current agri-food system and by individually based arguments that highlight personal health and well-being. Despite clear differences in their foci, the deeper values contained in each argument tend to be neglected or lost, while local innovations assume instrumental and largely market-based forms. By narrowing their focus to the rational and the economic, movement activists tend to overlook (or marginalize) the role of the sensual, the emotional, the expressive for maintaining layered sets of embodied relationships to food and to place. This paper seeks to show that cultural and nonrational elements are fundamental to local food discussions. It proceeds from the assumption that, without them as full partners, the movement cannot be sustained in any felt, practiced, or committed way. To this end, it discusses the concept of place and bodies in place, as well as the connections between the ecological and the cultural, the sensual and the scientific. It offers a new set of questions and conceptual tools with which advocates and activists may "ground," and thereby revalue and restore, the promise and practice of local food. Keywords: bodies - culture - local food - place - United States - values. Delind is at the Department of Anthropology, Michigan State University, East Lansing, MI. (JAEE)

Delind, Laura B., and Jim Bingen, "Place and civic culture: re-thinking the context for local agriculture," *Journal of Agricultural and Environmental Ethics* 21(2008):127-151. This article considers the qualitative concept of place – what it means, how it feels, how it is expressed, and how it is managed across time and space as (1) the appropriate context within which to study and promote local agriculture and (2) the locus of relationships, both cultural and political, that prefigure a local civic culture. It argues that civic as a description of local food and farming is conceptually and practically shallow in the absence of our ability to understand and to practice "being" in place. Using three vignettes from field research in northern Michigan, the article illustrates this interdependence by focusing on the ways in which place provides opportunities for learning, for play, for engagement, for identity formation, and for explicit political and policy initiatives – as prerequisites for civic awareness and action. The authors are in the Department of Anthropology, Michigan State University, East Lansing, MI.

DeLuca, Kevin Michael. "Rethinking Critical Theory: Instrumental Reason, Judgment, and the

Environmental Crisis." Environmental Ethics 23(2001):307-325. Through rethinking the trajectory of critical theory, I suggest the need to reconsider its environmental possibilities. The critical theory of the Frankfurt School, usually overlooked in environmental circles, provides a fecund opening for social and environmental theory with its recognition that the multiple catastrophes of the twentieth century are not extrinsic to civilization but intrinsic to the rationality of the Enlightenment. That is, the promise of the scientific domination of nature and rational forms of social organization simultaneously spawn the perils of environmental crises, fascism, genocide, world wars, and nuclear annihilation. With its theorizing of the domination of nature as involving the interconnection of humans and nature in a shared fate, the Frankfurt School provides a fundamentally ecocentric base for rethinking humanity-nature relations. Further, through its nuanced understanding of reason, critical theory provides a trenchant critique of instrumental reason and suggests judgment as the basis for a new ethic for humanity's interactions with the natural world. (EE)

Delwiche, Charles F, "The Genomic Palimpsest: Genomics in Evolution and Ecology", BioScience 54(no.11, November 2004):991-1001(11). Genomics is the discipline that has grown up around the sequencing and analysis of complete genomes. It has typically emphasized questions that involve the biological function of individual organisms, and has been somewhat isolated from the fields of evolutionary biology and ecology. However, genomic approaches also provide powerful tools for studying populations, interactions among organisms, and evolutionary history. Because of the large number of microbial genomes available, the first widespread use of genomic methods in evolution and ecology was in the study of bacteria and archaea, but similar approaches are being applied to eukaryotes. Genomic approaches have revolutionized the study of in situ microbial populations and facilitated the reconstruction of early events in the evolution of photosynthetic eukaryotes. Fields that have been largely unaffected by genomics will feel its influence in the near future, and greater interaction will benefit all of these historically distinct fields of study.

Demaine, Linda J. and Fellmeth, Aaron X., "Natural Substances and Patentable Inventions," Science 300(30 May 2003):1375-1376. Inventions are patentable but not discoveries of naturally occurring phenomena--that was the classic concept. But subtly and without fanfare this has fallen apart, notably in biology and also in the case of some purified inorganic substances and alloys, which are claimed to undergo a substantial transformation. This is regrettable. Suggestions for getting patent law reconstituted around the classical idea, which is not always easy to translate into current technology. Demeritt, David, "Ecology, Objectivity and Critique in Writings on Nature and Human Societies," Journal of Historical Geography 20(no. 1, 1994):20-37. A committed postmodern view of ecology, environmentalism, and environmental history. "Inspired by the Green Movement and invoking many of the analytical concepts of ecological science, environmental historians have offered trenchant criticisms of modern society and its relations with nature. Recently however, their position has been eroded on several fronts. Revisionists in ecological science have repudiated the idea of stable, holistic ecosystems used by many environmental historians and other Green critics to measure and assail the environmental damage wrought by society. Various assaults on the authority of science and history to represent nature and the past have also undercut the exclusive claims to knowledge that environmental historians rely upon

to legitimate their critique. I review these various challenges and the responses to them in turn. In the final part of the essay, I advance the position that environmental historians and other Green critics should end their search for foundational authority, be it in science or elsewhere, and appeal instead to diverse moral, political and aesthetic criteria to arbitrate between particular representations of nature in particular situations. This situation does not rule out appropriations from ecological science or other fields of knowledge where they prove useful and convincing, because, ultimately, environmental narratives are not legitimated in the lofty heights of foundational epistemology but in the more approachable and more contested realm of public discourse." Demeritt is in geography, University of British Columbia, Vancouver. (v9,#2)

A Michael Glazier Book. 1999. The editors and eighteen contributors (all but one) are on the faculty at the University of Portland, Oregon. Sample chapters: "Christian Values, Technology, and the Environmental Crisis," "Feeding the Hungry and Protecting the Environment," "Toward an Understanding of International Geopolitics and the Environment," "Development of Environmental Responsibility in Children," "A Sense of Place."

Den Nijs, H. C., D. Bartsch, and J. Sweet, eds., Introgression from Genetically Modified Plants into Wild Relatives. New York: Oxford University Press, 2004. Analysis of the likelihood of genetically modified plants spreading new genes from the cultivated plants into wild relatives. Den Nijs is at the University of Amsterdam.

Denevan, William M., "The Pristine Myth: The Landscape of the Americas in 1492," Annals of the Association of American Geographers 82(no. 3, 1992):369-385. The myth persists that in 1492 the Americans were a sparsely populated wilderness, "a world of barely perceptible human disturbance." There is substantial evidence, however, that the Native American landscape of the early sixteenth century was a humanized landscape almost everywhere. Populations were large. Forest composition had been modified, grasslands had been created, wildlife disrupted, and erosion was severe in places. Earthworks, roads, fields, and settlements were ubiquitous. With Indian depopulation in the wake of Old World disease, the environment recovered in many areas. A good argument can be made that the human presence was less visible in 1750 than it was in 1492. "There are no virgin tropical forests today, nor were there in 1492" (p. 375). Denevan is a geographer at the University of Wisconsin. (v6,#4)

Denfeld, Rene, "Old Messages: Ecofeminism and the Alienation of Young People from Environmental Education," pp. 246-255. Contrasts the romantic eco-radicalism endemic among "difference" or "gender" feminists with the serious and committed environmentalism that it displaces or discourages. Young people, and young women especially, have had deflected their serious interest in environmental questions by the sectarianism, the woolly self-righteousness, and the disdain for science that have characterized ecofeminism. Fortunately, "the message of ecofeminism, and of the environmental movement that adopts it, is unlikely ever to gain widespread support among upcoming generations" (p. 253). Denfeld is the author of The New Victorians: A Young Woman's Challenge to the Old Feminist Order. In Gross, Paul R., Levitt, Norman, and Lewis, Martin W., eds., The Flight from Science and Reason. New York: New York Academy of Sciences, 1996. Distributed by Johns Hopkins University Press. (v9,#2)

DePalma, Anthony, "Canada No Safe Haven for Birds or Bears," New York Times, March 13, 1998, p. A1, A8. Canada frequently has a worse record than the United States for conservation. There is a list of 291 endangered animals, birds, and insects, but there is no legislation to protect them. One problem is tension between the provincial and the national governments, with the provinces resisting any national regulation. Another is Canadian perceptions of the hassles over endangered species in the U.S. Another is refusal of Canadians to believe that, in relatively undeveloped Canada, there is a problem. (v9,#1)

DePalma, Anthony, with Romero, Simon, "Super Seeds Sweeping Major Markets, and Brazil May Be Next," New York Times (5/16/00). Herbicide-resistant soybeans, patents, and saving seeds. Monsanto's "Roundup Ready" soybean seeds allow farmers to use greater amounts of the herbicide Roundup without damaging their soybean crop. Farmers who use the genetically-altered soybeans allegedly save on chemicals and labor because they can apply a single herbicide without harming the soy plants. One study suggests they can cut costs by 4 percent. But in the U.S. and Canada, farmers must also pay a special technology fee for each bag of seed they use and they must agree not to save seed for the following year (a longstanding practice of farmers). They must also allow Monsanto investigators to inspect their fields

if they ever stop using the seed. Monsanto's informers' hot line has taken thousands of calls and Monsanto has brought charges against farmers for violating its patent rights. (One Canadian farmer brought to court by Monsanto claims the Roundup Ready plants in his field came from seed blow off passing grain trucks.) Although Monsanto claims its patents on such seeds are essential to its business, it has allowed Roundup Ready seeds to be sold in Argentina even though the country rejected its patent application. Farmers there routinely save the seed and don't have to pay the technology fee. 90 percent of that country's soy crop is now genetically-altered and U.S. farmers feel threatened by the cheaper costs of Argentinian soy producers. Brazil is trying to decide whether to allow transgenic soybeans into the country or to tap the European market for non-transgenic soybeans (European countries prohibit the use of modified seeds). Because U.S., Brazil, and Argentina together account for 80 percent of the world's soybean production and because soybean extracts are added to countless foods, Brazil's decision could have a significant affect on the availability of food free of genetically-modified material. (v.11,#2)

DePalma, Anthony, "Do Fish Have Water Rights?" New York Times, June 25, 2004, p. A22. On the Delaware River, efforts to keep trout in the river (which requires cool water) conflict with a thirsty New York City. The city has reservoirs upstream and if the level of the river drops too low, and the water heats up, the City has to release water to keep the fish cool, water which a thirsty New York needs. New York also has to keep a minimum flow so that Philadelphia and Trenton can have their share of the Delaware. (v. 15, # 3)

Depew, Brian R. Depew, There Is a Moral Obligation to Save the Family Farm, M.A. thesis, Colorado State University, summer 2005. Many persons have an attraction to family farms but without a clear moral argument for them, while family farms flounder. The two live options for agriculture in the United states are a family farm system or an industrial agribusiness system, and they differently affect individual autonomy, environmental stewardship, and community well-being, with the family farm system proving superior. This has significant implications for farm and rural policy. Depew is now pursuing a Ph.D. in rural sociology, also with further work in philosophy, at Michigan State University, East Lansing. The advisor was Michael Losonsky.

Derr, Mark, "It Takes Training and Genes to Make a Mean Dog," New York Times, Feb. 4, 2001, D1, D5. Pit bulls, Rottweilers, German shepherds, mastiffs and other breeds have been selected by breeders for aggressiveness, although they also have to be trained to be aggressive, often by abuse. This does not particularly represent what they are by original wild nature. Any breed can sometimes become aggressive, and dog experts dislike banning any particular breed. Pit bulls and Rottweilers account for more than half of the fatal attacks on humans in the U.S. About 40% of American dog owners get dogs primarily for protection. They often favor such breeds, but are naive or careless about keeping such dogs out of situations where this aggressiveness will erupt in unwanted attacks. (v.12,#3)

Derr, Mark "Alien Species Often Fit In Fine, Some Scientists Contend," NY Times (9/4/01): D4. Exotic species are not so bad after all? Billions of dollars a year are spent to destroy nonnative organisms and prevent their spread. But some are now questioning the assumption that alien species are inherently bad and that they are never acceptable in natural ecosystems. Many now claim that the distinction between exotic and native depends on arbitrarily picking a date and stipulating that organisms that show up after that date are exotic. Others worry about the impossibility of removing all exotics and point out that native species can also be invasive; it may be more important to control them than exotics. Furthermore, there are cases where endangered plants and animals depend on exotic species. According to ecologist Dan Simberloff, of the U.S.'s 150,000 species, 7,000 are alien and about 10% of these are invasive (the other 90% have fit into their environments and are considered naturalized).

Nevertheless, Simberloff argues for taking a precautionary approach toward exotics and claims "you don't want exotics in natural ecosystems." Another scientist has recently challenged the prevailing view that alien species reduce biodiversity, arguing that exotics add to the number of species in an environment and that even if they cause extinction, this will allow new species to evolve. For a provocative discussion of exotics, see Stephen Jay Gould, "An Evolutionary Perspective on Strengths, Fallacies, and Confusions in the Concept of Native Plants," in Joachim Wolschke-Bulmahn, ed., Nature and Ideology: Natural Garden Design in the Twentieth Century, Washington, DC: Dumbarton Oaks Research Library and Collection, 1997, available at <http://www.doaks.org/natur002.pdf>. (v.12,#4)

Derr, Mark, "Vanishing Livestock Breeds Leave Diversity Gap," New York Times (11/14/00): D3. Domestic animal diversity. Humans have domesticated about 40 species of animals and created thousands of breeds. Between 1,000 and 1,500 livestock breeds are at risk of extinction, representing about 30 percent of the most important domesticated species of birds and mammals. These animals are reservoirs of genetic diversity, play important roles in a number of ecosystems, and are sometimes central to the history and culture of human communities. 600 breeds of livestock have already gone extinct and another 78 are lost each year. The causes are the increasing industrialization of agriculture (including replacement of draft animals with machines and the loss of family farms), indiscriminate cross breeding, and a narrow focus on certain breeds—like Holsteins for milk—to the exclusion of others. Scientific breeding has produced industrial hens that lay 300 eggs a year compared to 30 for most indigenous birds, broiler chickens bred to mature in 6 to 7 weeks instead of the usual 12 weeks, and a doubling of milk production in Holsteins in the last 40 years. Scientists worry that levels of inbreeding necessary to attain these results reduce genetic diversity within the breeds and can lead to serious health problems. The eight million Holsteins in the U.S. are descendants of just 37 individuals. The greatest potential for losses of livestock diversity are in developing nations which are importing scientifically-improved livestock that replace their indigenous breeds. An example of a threatened breed in the U.S. is the "Gulf Coast native

sheep." Directly descendant from the stock of the first Spanish and French colonists, these sheep have been breeding largely free of human intervention for more than 300 years. They have adapted to the heat and humidity of the Gulf coast and have developed resistance to diseases and parasites that debilitate other breeds. Scientists are trying isolate genes responsible for this resistance in order to introduce them into commercially important breeds. (v.11,#4)

Derr, Patrick G. and McNamara, Edward M., Case Studies in Environmental Ethics. Lanham, MD: Rowman and Littlefield, 2003. 43 cases, typically 3-4 pages each. Hawaiian feral pigs, oil and ANWR, golden rice, Bhopal, monkey-wrenching, great apes, the Delhi Sands fly, and a host of others. Useful for discussion groups in classes in environmental ethics. Derr is in philosophy, Clark University. McNamara is an attorney. (v.14, #4)

Derr, Thomas Sieger, Nash, James A., Neuhaus, Richard John, Environmental Ethics and Christian Humanism. Nashville: Abingdon Press, 1996. A major article by Derr, "Environmental Ethics and Christian Humanism," with two replies: Nash, "In Flagrant Dissent: An Environmentalist's Contentions," and Neuhaus, "Christ and Creation's Longing." Derr holds that a wide range of "ecologists" (including biocentrists, animal rights advocates, and ecofeminists) distort the picture of humanity by submerging human life into "nature," ignoring human transcendence over it. The "spectacles" with which many "ecologists" view the world are badly ground and parts of their vision are distorted.

Nash, in a sharply stated response, claims that Derr does not see the issues clearly. "Derr's position must not stand unchallenged! It represents a widespread and unwarranted distortion of much environmental thought" (p. 105) Derr is too much focused on a confidence on human nature, and, indeed, on the capacity of modern, technological civilization to meet key challenges of the new ecological awareness. Derr has yet to find the correct balance of earth, humanity, and divinity.

Neuhaus agrees with Derr that the balance between the naturalistic and the humanistic dimensions of our world have been too lopsided on the naturalistic side. But he doubts that either Derr or the radical ecologists have a picture of the place of divinity in all this, which can be known only with an adequate Christology. Derr is a Reformed thinker, Nash a "liberal" Methodist, and Neuhaus a "conservative" Roman Catholic. (v9,#1)

Derr, Thomas S., Nash, James A. Neuhaus, John. Environmental Ethics and Christian Humanism. Nashville: Abingdon Press, 1996. 144pp. \$16.95 paper. Crossing swords with biocentrism, the animal rights movement, and ecofeminism Derr argues that Christian ethics requires an environmentalism that depends on good science for its practical judgments on compassion and a lively sense of justice for its social and economic policies, and on faithfulness to our God-given responsibilities as stewards of nature for its energy. James Nash and John Neuhaus offer critical responses to which Derr presents a rejoinder. (v8,#2)

Derrington, Frank W. Review of Environmental Ethics: An Overview for the Twenty-First Century. By Robin Attfield. Environmental Ethics 27 (2005):105-108.

Derrington, Frank W., "Is Coerced Fertility Reduction to Preserve Nature Justifiable?" Philosophy in the Contemporary World 8 (no. 1, Spring 2001):21-30. Human population growth must end, and the sooner the better, for both nature and a humanity that pursues boundlessly increasing affluence. Poisoning of organisms and massive extinctions result, exacerbated by population momentum. Infliction of pain and death largely for trivial reasons constitutes the ignoble denouement of our history. Reducing human numbers would be only one fitting response to recognition of this situation. Reliance on voluntary socio-economic reforms, including even the empowerment of women, appears unlikely to lead to below-replacement-level fertility, since families on average still elect to have more than two children. Discussed

are three reasons for thinking that coercive measures could help to engender a decreasing human population without negating preferable voluntary efforts to the same end. Hence some coercion to reduce fertility is justifiable. Derringham is in the Department of Social Science (Philosophy), New York City Technical College, Brooklyn. (v.13,#1)

derWeele (der Weele), Corvan, "Food Metaphors and Ethics: Towards More Attention for Bodily Experience," *Journal of Agricultural and Environmental Ethics* 19(2006):313-324.

Official Dutch food information apparently tries to avoid images but is implicitly shaped by the metaphor that food is fuel. The image of food as fuel and its accompanying view of the body as a machine are not maximally helpful for integrating two important human desires: health and pleasure. At the basis of the split between health and pleasure is the traditional mind/body dichotomy, in which the body is an important source of evil and bodily pleasure is sinful and dangerous. In the search for alternatives, new metaphors are proposed that integrate mind and body as well as pleasure and health. The relevance of metaphors for ethics is at least twofold. (1) Moral thought and theory are at least partly shaped by metaphors. In the light of this growing recognition, the analysis of morality needs innovation. (2) With regard to food, new metaphors, such as slow food, or the image of enjoyment as an art, enable a new search for morally responsible forms of hedonism, based on more love and respect for human as well as animal bodies. But new metaphors are specific and selective, just like old ones. I argue that a search for the best overall metaphor would be misguided, but that more diverse forms of attention to bodily aspects of life, including experiences related to food, will result in richer vocabularies of the body, the mind, and body/mind relations. This holds a promise of moral progress.

Keywords: enjoyment - food - health - metaphors - mind-body relations. der Weele is in the Applied Philosophy Group, Wageningen University, Wageningen, The Netherlands. (JAEE)

deShalit (de-Shalit), Avner, "From the Political to the Objective: The Dialectics of Zionism and the Environment," *Environmental Politics* 4(no. 1, 1995):70- . In the short history of the Zionist movement in Israel there have already been three interpretations of the concept of the environment, of which two are completely political. The attitude of the first Jewish immigrants to Palestine was one of anxiety. Coming from Europe, this new environment was absolutely unfamiliar to them, and they regarded the sandy

dunes, the desert and the swamps as a threat. They therefore romanticized it and their relationship to it, as is done by children who are afraid of witches, fire, and so forth. They claimed that the reunion of the Jewish soil with the Jewish soul would emancipate the Jews from their bourgeois character. The second interpretation was "conquering" the new environment, which was a way of making it more familiar and human-friendly. The environment which has been described as "nothingness," "emptiness," "desolation," had to be "made to flourish" and "civilized." Zionism adopted different interpretation of the environment in order to create a new type of Jew, or to prove that Zionism was right. A third possibility, now arising, may be to appreciate the environment more objectively, but it is not yet clear whether the environment can be treated non-politically. de-Shalit teaches politics at the Hebrew University, Jerusalem. (v6,#4)

deShalit (de-Shalit), Avner, "Bargaining with the Not-yet-born: Gauthier's Contractarian Theory of Inter-Generational Justice and its Limitations," International Journal of Moral and Social Studies 5(1990):221-234. If one follows the contractarian premises and approach to environmental policies and inter-generational justice, one will not be able to derive obligations to future generations from these principles. Nor will one get help in arriving at any sense of balance between contemporaries and future people. (v5,#2) (Israel)

deShalit (de-Shalit), Avner, Why Posterity Matters. London: Routledge, 1995. A comprehensive examination of our duties to future generations, arguing that our obligations toward future generations are a matter of justice, not of charity or supererogation. We have a duty to consider them when we distribute access to natural resources, decide on environmental policies, and plan budgets. This raises problems for conventional theories of justice and requires a new communitarian theory of intergenerational justice, which can serve as the moral basis for environmental policy. This book is in the Routledge series, Environmental Philosophies, edited by Andrew Brennan. de-Shalit teaches environmental ethics and political policy at the Hebrew University, Jerusalem. (v5,#3)

deShalit, (de-Shalit), Avner, "Environmental Policies and Justice Between Generations," European Journal of Political Research 21(1992):307-316. (v4,#1)

deShalit (de-Shalit), Avner, "Environmental Policies and Justice Between Generations," European Journal of Political Research 21(1992):307-316. In environmental policy, over and above the relations between humans and nature, there are relations between contemporaries and future generations. Many environmental policies can be seen as a matter of distribution of access to goods between contemporaries and future generations. A theory of justice between generations enables political theorists to evaluate environmental problems with a new approach. (v5,#2) (Israel)

deShalit (de-Shalit), Avner, "From the Political to the Objective: The Dialectics of Zionism and the Environment," Political Studies 4: 70-88. Is the argument that we can only conceive of the "environment" in political terms far-fetched? Is an objective understanding of the concept of the "environment" possible? By an analysis of three phases in the relationship between Zionism and the environment, it can be argued, first, that not only the developmental but also the romantic attitudes to the environment regard the latter instrumentally and both constituted political definitions of the environment; and second, that a direct transition from a romantic-ruralist attitude to the environment to a modern, scientifically-based environmentalism is impossible, and that the antithesis of the ethos of development has been necessary for the instrumental and political approach to the environment to be abandoned. (v6,#2)

deShalit (de-Shalit), Avner, The Environment Between Theory and Practice. Oxford: Oxford University Press, 2000. Why do so many environmental activists claim that there is a gap between the questions that environmental philosophers discuss and the issues that motivate environmental activists? The author attempts to answer this question and then to bridge this gap by combining tools of political philosophy

with questions of environmental ethics and politics. He defends a radical position in relations to both environmental protection and social policies in order to put forward a theory, which is not only philosophically sound, but also relevant to the practice of environmental activism. de-Shalit develops and applies what he calls "public reflective equilibrium" as a new method to be used by philosophers who are engaged in applied philosophy. Avner de-Shalit is professor of political and environmental theory, The Hebrew University of Jerusalem, and Associate Fellow, Oxford Centre for Environment, Ethics and Society. (v.11,#3)

deShalit (de-Shalit), Avner, and Moti Talias, "Green or Blue and White? Environmental Controversies in Israel," in Environmental Politics 3(no. 2, Summer 1994):273- . Blue and white are the colors of Israel, here contrasted with green. Environmental controversies in Israel are characterized by the dominance of non-anthropocentric modes of reasoning. In that respect they are different from the modes of reasoning in other western countries. We analyze the arguments put forward in favor of conservation in Israel, and claim that this is not accidental, but is related to a profound cleavage between a non-anthropocentric attitude and the Israeli-Zionist ethos of development, which has governed Israeli political thought since the 1930's. deShalit (de-Shalit), Avner, "Urban Preservation and the Judgment of Solomon," Journal of Applied Philosophy 4(1994):3-13. "Facing heretofore unknown waves of new immigrants, the Israeli Government and the mayor of Jerusalem issued a comprehensive development program, including rapid and massive construction. Cities with historical and aesthetic uniqueness, particularly Jerusalem, are likely to lose their special features and beauty. How can an argument in favor of conservation of the special beauties of such cities be advanced in the light of the urgent need to supply shelter and jobs for their inhabitants? The paper has to aims: to analyze the reason for environmental ethics' failure to discuss urban preservation so far, and to put forward a rationale for urban preservation. The latter derives from the political wisdom of King Solomon and from the notion of anthropocentric intrinsic value. de-Shalit teaches political science and environmental policy at the Hebrew University of Jerusalem. deSilva (de Silva), Padmasiri, Environmental Philosophy & Ethics in Buddhism. Macmillan: London; St. Martin: New York, 1998. (1) Following an introduction to the central theories and issues in Western environmental ethics, de Silva develops an account of Buddhist environmental philosophy, ethics, economics and a Buddhist pedagogy for environmental education. (2) A central claim is that the current environmental crisis is a product of a "thinking disorder, and as mentioned in a recent review, "the author sets to demonstrate that the means of healing this virulent disorder could well come from the developing world, specially from ancient Buddhist teachings." This work is the product of a UNESCO project searching for an environmental ethic across the cultures and religions of the Asian region. (3) The critique of narrow epistemological paradigms, the call for a multi-dimensional pedagogy, the need for an environmental ethics that will actually influence people--these claims are backed by Antonio Damasio's claim that we make bad decisions, when we have no access to "emotional learning." The concept of "ecological sensibility" is another important ingredient of this book. (v.11,#1)

DeSilva (De Silva), Sena S., and Giovanni M. Turchini, "Towards Understanding the Impacts of the Pet Food Industry on World Fish and Seafood Supplies," Journal of Agricultural and Environmental Ethics 21(2008):459-467. The status of wild capture fisheries has induced many fisheries and conservation scientists to express concerns about the concept of using forage fish after reduction to fishmeal and fish

oil, as feed for farmed animals, particularly in aquaculture. However, a very large quantity of forage fish is being also used untransformed (fresh or frozen) globally for other purposes, such as the pet food industry. So far, no attempts have been made to estimate this quantum, and have been omitted in previous fishmeal and fish oil exploitation surveys. On the basis of recently released data on the Australian importation of fresh or frozen fish for the canned cat food industry, here we show that the estimated amount of raw fishery products directly utilized by the cat food industry equates to 2.48 million metric tonnes per year. This estimate, plus the previously reported global fishmeal consumption for the production of dry pet food suggest that 13.5% of the total 39.0 million tonnes of wild caught forage fish is used for purposes other than human food production. This study attempts to bring forth information on the direct use of fresh or frozen forage fish in the pet food sector that appears to have received little attention to this date and that needs to be considered in the global debate on the ethical nature of current practices on the use of forage fish, a limited biological resource. The authors are at the School of Life & Environmental Sciences, Deakin University, Warrnambool, Victoria, Australia.

DesJardins, Joseph, Environmental Ethics: An Introduction to Environmental Philosophy. 3rd ed. Belmont, CA: Wadsworth/Thomson Learning, 2001. Concise, summary, balanced descriptions of available positions, sketches of historical developments, readable by undergraduates without compromise of serious argument; conclusions are often provisional and open-ended, intended to keep the student on inquiry. New sections on the idea of wilderness, biocentric ethics, and environmental pragmatism. More integration of cases into chapter material. Broadened discussion of the debate over consumption and population, now moving beyond energy policy to philosophical examination of a wider range of ethical responsibilities to future generations. The first edition was in 1993; the second in 1997. Des Jardins is in philosophy at the College of Saint Benedict/St. John's University, St. Joseph, MN. (v.11,#4)

DesJardins, Joseph R. (Des Jardins), Environmental Ethics: An Introduction to Environmental Philosophy. 272 pages, paper. Wadsworth, 1993. Sections on basic ethical concepts, forests, pollution,

climate change, economics, energy, future generations, duties to animals, biocentrism, the land ethic, deep ecology, ecofeminism. Discussions include the spotted owl controversy, monkey-wrenching and the Rio Summit. End of chapter summaries and discussion questions. Makes a particular effort to survey all the areas of the field, yet a reasonably compact text. Des Jardins is professor of philosophy at the College of St. Benedict/St. Johns University, St. Joseph, MN. (v3,#4)

DesJardins, Joseph, ed., Environmental Ethics: Concepts, Policy, Theory. Mountain View, CA: Mayfield Publishing Co., 1999. 620 pages. \$ 42.00 paper. A sizeable anthology that covers the field, and the latest entry into a market with now over two dozen anthologies. This one features many case studies. Sections (Chapters): 1. Philosophical Ethics and Environmental Public Policy. 2. The Environment in Western Thought. 3. Is There an Environmental Crisis? 4. Economics and Environmental Policy. 5. Aesthetics and Spiritual Values. 6. Extensionism and Anthropocentrism. 7. Holism: Ecology and Ethics. 8. Pollution. 9. Ethics and Animals. 10. Ethics and Land. 11. Wilderness Preservation. 12. Growth and Development. 13. Environmental Justice. 14. International Relations and the Environment. 15. Deep Ecology, Social Ecology, and Ecofeminism. 16. Political Theory and the Environment. 17. Multicultural Perspectives on the Environment. 18. Environmental Pragmatism. Should prove a solid contender against comparable such popular anthologies as Botzler and Armstrong, Environmental Ethics: Divergence and Convergence and Pojman, Environmental Ethics: Readings in Theory and Application. Deuffic, Philippe, and Jacqueline Candau, "Farming and Landscape Management: How French Farmers are Coping with the Ecologization of Their Activities." Journal of Agricultural and Environmental Ethics 19(2006):563-585. In Europe, an increasing share of public subsidies for food production is being transferred towards the production of goods and environmental services. Today, farmers hesitate between the quest for technical and economic performance, which has been the paradigm of their professional activities since the 1960s, on one hand, and taking account of the environmental concerns that have been imposed since the middle of the 80s, on the other. Is it possible for farmers to continue to work according to the paradigm of the producer of agri-food goods, and how do they react to the ecologization of their activities? In this paper, we will see the difficulties and sources of tension induced by landscape maintenance in the daily professional practice of the farmers. We will see that the professional identity of the farmers is profoundly brought into question by these changes (substitution of strictly "agricultural issues" by more general concerns such as "rural issues," substitution of the farmer by the "ecologized" peasant...). The topic of landscape reveals social strains between farmers. It also raises the question of the legitimacy of farmers to define the sense of their activities by themselves. Finally we will see that environmental orientations do not systematically open up new prospects for all farmers; they sometimes contribute to increase the inequalities between farmers (financial support proportional to land property, marginalization of farmers who are less socially integrated...). Keywords: agri-environment - farmers professional identity - landscape - multifunctionality - rural amenities - social contract. The authors are with Cemagref, UR Agriculture and Dynamics of Rural Areas, Cestas, France. (JAEE)

Deutsch, Claudia H. "A Threat So Big, Academics Try Collaboration." *New York Times* (December 25, 2007). Scholars from different disciplines are crossing lines to share ideas about reducing the threat from climate change. This includes a number of university-sponsored sustainability institutes.

Deutsch, Eliot. "A Metaphysical Grounding for Nature Reverence: East-West." Environmental Ethics 8(1986):293-99. I argue for the possibility of a creative relationship between man and nature which will inform the basic decision makings that confront us in the concrete concerns of environmental ethics today. This relationship, which I call "natural reverence," is essentially an attitudinal one which recognizes the togetherness of man and nature in freedom. Contrasting Kant's treatment of the sublime with certain ideas to be found in Indian philosophy--namely, the idea of a radical discontinuity, thought to

obtain between "reality" and "nature" (maya in Vedanta), and the idea of karman as involving modes of human making--I show the manner in which nature can become value laden and how we can work with nature in a manner analogous to that of an artist working with his/her medium in a kind of creative play. Deutsch is the editor of Philosophy East and West, Honolulu, HI. (EE)

Devall, Bill and George Sessions. "The Development of Natural Resources and the Integrity of Nature." Environmental Ethics 6(1984):293-322. During the twentieth century, John Muir's ideas of "righteous management" were eclipsed by Gifford Pinchot's anthropocentric scientific management ideas concerning the conservation and development of Nature as a human resource. Ecology as a subversive science, however, has now undercut the foundations of this resource conservation and development ideology. Using the philosophical principles of deep ecology, we explore a contemporary version of Muir's "righteous management" by developing the ideas of holistic management and ecosystem rehabilitation. Sessions is at the Philosophy Dept., Sierra College, Rocklin, CA. Devall is at the Sociology Dept., Humboldt University, Arcata, CA. (EE)

Devall, Bill, and George Sessions, Deep Ecology: Living as if Nature Mattered. Salt Lake City: Peregrine Smith, 1985. Pp. xi, 267. The most charitable way to describe Deep Ecology as a philosophical position is that it is an attempt to raise our "ecological consciousness" so that we may see the unity of humanity and nature. Unfortunately, the position, as it has been staked out in the literature, is so vague that it includes a host of seemingly conflicting elements: e.g., both biospecies equality and holism. Devall and Sessions do little to explain the position and argue for it. This is disheartening, for many of the features of Deep Ecology are philosophically significant in the development of an environmental ethic-- particularly the critique of what Devall calls "Reform Environmentalism." But Devall and Sessions seem to be writing for the converted; there is little convincing argument. Argument, however, is possible: witness Session's appendix on Deep Ecology and "fascism" where he defends Deep Ecology and Holism from critics who say it submerges the value of individuals. Unfortunately, the rest of the book is a hodgepodge of many Devall and Sessions papers collected as a book. This should be read as a necessary evil ... but we still need a sustained description and defense of the Deep Ecology position. (Katz, Bibl # 1)

Devall, Bill, "The Deep, Long-range Ecology Movement: 1960-2000--A Review," Ethics and the Environment 6(no. 1, 2001):18-41. Aarne Naess, in a seminal paper on environmental philosophy, distinguished between two streams of environmental philosophy and activism--shallow and deep. The deep, long-range ecology movement has developed over the past four decades on a variety of fronts. However, in the context of global conferences on development, population, and environment held during the 1990s, even shallow environmentalism seems to have less priority than demands for worldwide economic growth based on trade liberalization and a free market global economy. Devall was in sociology, now emeritus, Humboldt State University, Arcata, CA. (E&E)

Devall, Bill, ed., Clearcut: The Tragedy of Industrial Forestry. San Francisco: Sierra Club/Earth Island Books, 1993. A large book designed for visual impact with (when the book is opened) almost poster-sized pictures of clearcut devastation, often with remnants of the forest lingering nearby in their beauty. The book is a product of the Foundation for Deep Ecology. There are some short essays: Warwick Fox, "The Recognition of Intrinsic Value in the Writing of Legislation"; R. Edward Grumbine, "Policy in the Woods"; "The Ecoforestry Declaration of Interdependence"; Chris Maser, "The Twenty-First-Century Forester"; Alan Drengson, "Remembering the Moral and Spiritual Dimensions of Forests"; Reed Noss, "A Sustainable Forest is a Diverse and Natural Forest"; Dave Foreman, "The Big Woods and Ecological Wilderness Recovery"; and others. The book has provoked a response by the American Forest and Paper Pulp Association: Closer Look: An On the Ground Investigation of the Sierra Club's Book: Clearcut. The response claims that the book deliberately misleads readers, blaming clearcutting and industrial forestry for impacts actually caused by wildfire, insect and disease infestation, and other natural disasters. For the

response call 202/463-2756. (v7,#1)

Devos, Yann, Pieter Maesele, irk Reheul, Linda Van Speybroeck and Danny De Waele, "Ethics in the Societal Debate on Genetically Modified Organisms: A (Re)Quest for Sense and Sensibility," *Journal of Agricultural and Environmental Ethics* 21(2008):29-61. Via a historical reconstruction, this paper primarily demonstrates how the societal debate on genetically modified organisms (GMOs) gradually extended in terms of actors involved and concerns reflected. It is argued that the implementation of recombinant DNA technology out of the laboratory and into civil society entailed a "complex of concerns." In this complex, distinctions between environmental, agricultural, socio-economic, and ethical issues proved to be blurred. This fueled the confusion between the wider debate on genetic modification and the risk assessment of transgenic crops in the European Union. In this paper, the lasting skeptical and/or ambivalent attitude of Europeans towards agro-food biotechnology is interpreted as signaling an ongoing social request – and even a quest – for an evaluation of biotechnology with Sense and Sensibility. In this (re)quest, a broader-than-scientific dimension is sought for that allows addressing the GMO debate in a more "sensible" way, whilst making "sense" of the different stances taken in it. Here, the restyling of the European regulatory frame on transgenic agro-food products and of science communication models are discussed and taken to be indicative of the (re)quest to move from a merely scientific evaluation and risk-based policy towards a socially more robust evaluation that takes the "non-scientific" concerns at stake in the GMO debate seriously. The authors are at Ghent University, Belgium.

deVries, R. B. M., "Intrinsic Value and the Genetic Engineering of Animals," *Environmental Values* 17(2008):375-392. The concept of intrinsic value is often invoked to articulate objections to the genetic engineering of animals, particularly those objections that are not directed at the negative effects the technique might have on the health and welfare of the modified animals. However, this concept was not developed in the context of genetic engineering. Given this external origin, this paper critically examines the assumption that the concept of intrinsic value is suitable to articulate and justify moral objections more specifically directed at the genetic engineering of animals. I discuss four different theories of

intrinsic value, two of which defend a moral concept of intrinsic value and two a non-moral one. I conclude that only a particular non-moral concept of intrinsic value is suitable to express specific objections to genetic engineering, because these objections can only be defended in the form of indirect duties regarding animals.

DeVries (De Vries), Rob, "Genetic Engineering and the Integrity of Animals," Journal of Agricultural and Environmental Ethics 19(2006):469-493. Genetic engineering evokes a number of objections that are not directed at the negative effects the technique might have on the health and welfare of the modified animals. The concept of animal integrity is often invoked to articulate these kind of objections. Moreover, in reaction to the advent of genetic engineering, the concept has been extended from the level of the individual animal to the level of the genome and of the species. However, the concept of animal integrity was not developed in the context of genetic engineering. Given this external origin, the aim of this paper is to critically examine the assumption that the concept of integrity, including its extensions to the level of the genome and the species, is suitable to articulate and justify moral objections more specifically directed at the genetic engineering of animals. Keywords: animal integrity - duties towards animals - genetic engineering of animals - genetic integrity - species integrity. de Vries is in the Faculty of Science, Department of Philosophy and Science Studies, Radboud University Nijmegen & Centre for Ethics, Nijmegen, The Netherlands. deWaal (de Waal), Frans B. M., "Survival of the Kindest," Chronicle of Higher Education, August 7, 1998, B4-B5. A summary of de Waal's claims contesting the selfish genes theories, which he has made recently in a number of publications, such as Good Natured (Harvard University Press). There is frequently genuine altruism in animals (and people). "When George Williams ... declared ... that 'natural selection maximizes short-sighted selfishness,' he confused the utilitarian language of evolutionary biology with what actually drives animals and people to act. Selfishness implies an intention to serve oneself, a purpose that depends on knowing what one stands to gain from a particular behavior. Without such knowledge, selfishness is a much more problematic concept than many evolutionary thinkers realize. ... In my work on the evolution of empathy and morality, I have found many instances of animals' caring for one another and responding to one another's distress--evidence so rich that I am convinced that survival depends not only on strength in combat but also at times on cooperation and kindness."

"The helping behaviors shown by dolphins, gorillas, or people toward strangers in need probably evolved in the context of close knit group life, in which most such actions benefited relatives and companions able to return the favor. The impulse to help was therefore never totally without self-interest and survival value to the individual displaying it. But, as so often is the case, the impulse became divorced from the consequences that shaped its evolution. This permitted it to express itself even when payoffs were highly unlikely. In this sense, the impulse became genuinely unselfish." De Waal is in psychology and primate behavior at Emory University. (v.9,#3)

deWaal (de Waal), Frans, Good Natured: The Origins of Right and Wrong in Humans and Other Animals. Cambridge, MA: Harvard University Press, 1996. The extent to which requisites of morality can be recognized in other animals, especially primates. de Waal strenuously objects to a current tendency among biologists to ascribe various negative descriptions to animals, such as their being "selfish," or "cheaters" or "deceiving" or "greedy" or "having enemies," or "murdering" with a simultaneous refusal to ascribe various positive traits to them. Biologists go to great lengths, unnecessarily so, to argue away all evidence of animal altruism, interpreting it as disguised selfishness, or kin selection, or nepotism, and so on. Animals, particularly those close to us, display an enormous spectrum of emotions and different kinds of relationships. It is only fair to reflect this fact in a broad array of terms. If animals can have

enemies, they can have friends. If they can cheat, they can be honest. If they can be spiteful, they can also be kind and altruistic. Semantic distinctions between animal and human behavior often obscure fundamental similarities; a discussion of morality will be pointless if we allow our language to be distorted by a denial of benign motives and emotions in animals. de Waal works at the Yerkes Regional Primate Center in Atlanta, Georgia. Dewar, Heather, "Everglades to Be Restored, Sort of," Lexington Herald-Leader, 18 June 1998, B9
Everglades restoration plan (Draft) to cost \$7.5 billion. In June 1998, the US Army Corps of Engineers completed its draft plan for undoing the damage it did to the Everglades in the late 1960s. That was when the Corps finished the 1600-mile long network of levees and canals that drain the swamps and marshes, creating space for urban development and 750,00 acres of farmland. The canals deprive the Everglades of 20% of its natural waterflow. Now wading birds are gone from many regions, and some species are down to about one-twentieth their pre-canal numbers. The canal project cost \$252 million. The restoration is estimated to cost \$7.5 billion. South of Lake Okeechobee, the Corps will dig 100 wells, each a thousand feet deep, that will store water during the rainy season. Then during the dry season, the water will be pumped into dry areas, restoring an estimated 40-60,000 acres of wetlands. The technology has never been tested on this grand a scale. Another alternative, costing far less but politically unacceptable, would be to rip out the levees and allow the natural flow of water across the region. Originally more than 1.5 million acres in size, the Everglades has been reduced by more than half. Ecologist John Ogden of the South Florida Water Management District, a member of the team drafting the proposal, laments that the remnant cannot function naturally without human assistance and intrusive high-technology. Restoring the Glades will give the Corps something to do for at least fifteen years. The draft proposal will be officially presented for public comment in October 1998 and then will go to Congress for funding in July 1999. The draft plan is being supported by the Audubon Society. In Sri Lanka, the extremely poor Vedda people were relocated in the Mahaweli Development Scheme, which called for a forest and wildlife reserve in some of their best hunting and food gathering areas.

DHondt, Steven, Rutherford, Scott, and Spivack, Arthur J., "Metabolic Activity of Subsurface Life in Deep-Sea Sediments," Science 295(15 March 2002):2067-2069. There is a surprising amount of life buried deep in marine sediments (to one kilometer), mostly microorganisms (procaryotes) that may constitute from one-tenth to one-third of Earth's biomass. But most of it is quite low in metabolic activity (most in the first few centimeters) and lower down the organisms are mostly inactive--just there in a suspended state until conditions change that permit metabolic activity. The authors are in oceanography, University of Rhode Island. (v.13,#2)

Dial, Kenneth P.; Randall, Ross J.; Dial, Terry R., "What Use Is Half a Wing in the Ecology and Evolution of Birds?," BioScience 56 (no.5, May 2006): 437-445 (9). The use of incipient wings during

ontogeny in living birds reveals not only the function of these developing forelimbs in growing birds' survival but also the possible employment of protowings during transitional stages in the evolution of flight. When startled, juvenile galliform birds attempt aerial flight even though their wings are not fully developed. They also flap their incipient wings when they run up precipitous inclines, a behavior we have described as wing-assisted incline running (WAIR), and when they launch from elevated structures. We argue that avian ancestors may have used WAIR as an evolutionary transition from bipedal locomotion to flapping flight.

Diamond, Adam, Book review of Lisa Nicole Mills, Science and Social Context: The Regulation of Recombinant Bovine Growth Hormone in North America (Montreal: McGill-Queens University Press, 2002). Journal of Agricultural and Environmental Ethics 18(2005):509-513. (JAEE)

Diamond, Jared, Guns, Germs, and Steel: The Fates of Human Societies. New York: Norton, 1997. Diamond examines the environmental factors that influenced the shift from hunter-gatherers to farming-based cultures, to provide a better understanding of how human societies came to be. Societies with the advantages of reliable food sources and domesticated animals tended to develop writing, technology, government, and organized religion as well as military weapons, resulting in their expansion at the expense of less sophisticated societies. Location and environment, not superior culture, are the deciding factor in the construction of dominant civilizations. So superiority is an illusion, it's all a matter of environmental good fortune. Diamond is a UCLA physiologist and cultural ecologist, who does research among New Guinea tribes. (EE v.12,#1)

Diamond, Jared, The Third Chimpanzee: The Evolution and Future of the Human Animal. New York: HarperCollins, 1992. 407 pages. Diamond claims that the golden age of indigenous peoples of the past never was. Preindustrial societies exterminated species, destroyed habitats, exploited their resources, and undermined their own existence for thousands of years, and archaeological finds at Polynesian, American Indian, Madagascar, Easter Island, Maya, Aztec, and other sites demonstrate this. The native peoples

were not particularly either gentle or nature-loving. But they were more ignorant than we. "Tragic failures become moral sins only if one should have known better from the outset." Our scientific knowledge enables us to know that we are engaging in "self-inflicted ecological disasters." It is "beyond understanding to see modern societies repeating the past's suicidal ecological mismanagement." Diamond is a UCLA physiologist, cultural ecologist, and anthropologist, who spends half the year in New Guinea among tribes that were still living in the Stone Age until fifty years ago. (v5,#1)

Diamond, Jared, *Collapse: How Societies Choose to Fail or Succeed*. New York: Viking, 2005. By the author of *Guns, Germs and Steel*. Hit the NY Times best seller list for several weeks. Examines reasons for social collapse, ranging over several fairly ancient societies, such as Easter Island, the Mayans and Norse Greenland, to contemporary societies such as Haiti, China, and Australia, and to global industrial society. Diamond persistently asks why societies make decisions which turn out to be disastrous, as well as what this means for us today. In the end, he discusses twelve sets of environmental problems now confronting global society, where the failure to resolve any one of which will likely lead down the road of global social collapse. "No cure is even under serious discussion for these problems, which will only get worse" (p. 500). Quite a goad to further action. (Thanks to Andrew McLaughlin.)

Dias De Oliveira, ME; Vaughan, BE; Rykiel, EJ, "Ethanol as Fuel: Energy, Carbon Dioxide Balances, and Ecological Footprint," *BioScience* 55 (no. 7, July 2005): 593-602. The major contributor to global warming is considered to be the high levels of greenhouse gas emissions, especially carbon dioxide (CO₂), caused by the burning of fossil fuel. Thus, to mitigate CO₂ emissions, renewable energy sources such as ethanol have been seen as a promising alternative to fossil fuel consumption. Brazil was the world's first nation to run a large-scale program for using ethanol as fuel. Eventually, the United States also developed large-scale production of ethanol. In this study, we compare the benefits and environmental impacts of ethanol fuel, in Brazil and in the United States, using the ecological footprint tool developed by Wackernagel and Rees.

Dickens, Peter, Reconstructing Nature: Alienation, Emancipation and the Division of Labour. London: Routledge, 1996. 217 pages. £14 paper. Social constructivism takes many forms. From a Marxist, and hence materialist, point of view the wholesale deconstructivism favored by "postmoderns" and discourse analysts goes too far. Dickens wants to correct an environmentalism he regards as "characterised by a profound failure to understand their relations with nature" (p. 149). He also rejects the idea that nature is "a purely social construction with no references to real and material processes 'out there.'" Dickens targets what he refers to as "strong" social constructivism. He wants this label to apply equally to both those explicitly constructivist critics of environmental discourses who regard "nature" as simply a product of human social practices and those environmentalists who entirely reject this view and wish to retain (and in his terms reify) a pure nature untouched by human hands. The former he regards as idealists in the sense that they come to regard "nature" as an infinitely plastic creation of the human mind. The latter are idealists in the different sense of being unwitting dupes who accept a romanticized picture of the human/natural relations without recognizing it for the social construction it really is. Dickens is in urban studies and social policy at the University of Sussex, UK. Reviewed by Mick Smith, "What's Natural? Dickson, Barnabas. "The Ethicist Conception of Environmental Problems." Environmental Values 9(2000):127-152. Abstract: Ethicist assumptions about the causes and solutions of environmental problems are widely held within environmental philosophy. It is typically assumed that an important cause of problems are the attitudes towards the natural environment held by individuals and that problems can be solved by getting people to adopt a more ethical orientation towards the environment. This article analyses and criticises these claims. Both the highly mediated nature of the relationship between individuals and the natural environment and the pervasive pressure on firms in market economies to reduce their costs provide reasons to question the ethicist assumptions. KEYWORDS: Ethicism, environmental ethics, environmental problems, solutions. Barnabas Dickson resides at Holmsgarth, Blackheath, Wenhaston, Suffolk IP19 9ET, UK. (EV)

Diehm, Christian, "Identification with Nature: What it Is and Why it Matters," Ethics and the Environment 12(no. 2, 2007):1-22. This essay examines the content and significance of the notion of "identification" as it appears in the works of theorists of deep ecology. It starts with the most frequently

expressed conception of identification-termed "identification-as-belonging" -and distinguishes several different variants of it. After reviewing two criticisms of deep ecology that appear to target this notion, it is argued that there is a second, less frequently noticed type of identification that appears primarily in the work of Arne Naess-"identification-as-kinship." Following this analysis, it is suggested that identification-as-kinship may be less vulnerable to the criticisms that are aimed at identification-as-belonging. Diehm is in philosophy, University of Wisconsin, Stevens Point.

Diehm, Christian. "Arne Naess and the Task of Gestalt Ontology." Environmental Ethics 28(2006):21-35. While much of Arne Naess's ecosophy underscores the importance of understanding one's ecological Self, his analyses of gestaltism are significant in that they center less on questions of the self than on questions of nature and what is other-than-human. Rather than the realization of a more expansive Self, gestalt ontology calls for a "gestalt shift" in our thinking about nature, one that allows for its intrinsic value to emerge clearly. Taking such a gestalt shift as a central task enables Naess to avoid some common criticisms of his view. (EE)

Dieterle, J. M. "Unnecessary Suffering." Environmental Ethics 30(2008):51-67. The philosophical literature on the ethical treatment of animals is largely divided between two distinct kinds of approaches: (1) the rights-based approach; and (2) the utilitarian approach. A third approach to the debate is possible. The general moral principle "It is wrong to cause unnecessary pain or suffering" is sufficient to render many human activities involving nonhuman animals morally wrong, provided an appropriate account of unnecessary is developed to give the principle its force. The moral principle can be easily applied to several general areas of human activity: food, research, and entertainment. (EE)

DiSilvestro, Roger L., Reclaiming the Last Wild Places: A New Agenda for Biodiversity. New York: John Wiley & Sons, 1993. 266 pages. "This is a book about boundaries. ... Territorial boundaries are ancient; they are artifacts dating from a primordial world. They are, in essence, established for the exploitation of the earth. ... Only in the past century has humanity begun to set the protection of wildlands as a broad social goal, creating national parks, national forests, wildlife refuges, even protected wilderness areas. This is something truly new under the sun, and every protected wild place is a monument to humanity's uniqueness. The greatest qualitative difference between us and nonhuman animals is not that we can change and modify our environment. Practically every living creature does that, from the AIDS virus that destroys its own habitat, to herds of hoofed animals that trim grasslands, to chimpanzees that make spoons from leaves, to birds that build nests, to ants and termites living in teeming arthropod cities. But we are the first living things, as far as we know, to make a choice about the extent to which we will apply our abilities to influence the environment. We not only can do, but we can choose not to do. Thus, what is unique about the boundaries we place around parks and other sanctuaries is that these boundaries are created to protect a region from our own actions. ... No longer can we think of

ourselves as masters of the natural world. Rather, we are partners with it" (pp. xiii-xv). The final chapter is "Ethics, Economics, and Ecosystems."

Dixon, Ben, "Darwinism and Human Dignity," *Environmental Values* 16(2007): 23-42. James Rachels argued against the possibility of finding some moral capacity in humans that confers upon them a unique dignity. His argument contends that Darwinism challenges such attempts, because Darwinism predicts that any morally valuable capacity able to bestow a unique dignity is likely present to a degree within both humans and non-human animals alike. I make the case, however, that some of Darwin's own thoughts regarding the nature of conscience provide a springboard for criticising Rachels's claim here. Using Darwin's thoughts regarding conscience, I begin the project of grounding a revised account of human dignity in the human tendency to enshrine products of conscience within institutions. Specifically, I argue that this new account of human dignity is partly contingent upon humans creating institutions morally respectful of the values present within non-human nature. Dixon is in philosophy, University of Maryland, Baltimore County, Baltimore.

Dixon, Beth A., "The Feminist Connection between Women and Animals," Environmental Ethics 18(1996):181-194. Comparison of similarities between women and animals does not necessarily show that animals are oppressed, much less that they are oppressed by patriarchy. Moreover, by seeking to establish symbolic connections, ecofeminists run the risk of essentializing women as emotional and bodily and closer to nature than men. Feminists have little to gain by concentrating exclusively on how the concepts of woman and animal overlap. Likewise, there is little to be gained for animal liberation by comparing women and animals in theory and practice. Feminists have obligations to liberate animals to the degree that they have obligations to liberate any oppressed population, but not because there are either theoretical, practical, or symbolic connections between women and animals. Dixon is in philosophy, State University of New York at Plattsburgh. (EE)

Dixon, Beth, "Animal Emotions," Ethics and the Environment 6(no. 2, 2001):22-30. Recent work in the area of ethics and animals suggests that it is philosophically legitimate to ascribe emotions to non-human animals. Furthermore, it is sometimes argued that emotionality is a morally relevant psychological state shared by humans and nonhumans. What is missing from the philosophical literature that makes reference to emotions in non-human animals is an attempt to clarify and defend some particular account of the nature of emotion, and the role that emotions play in a characterization of human nature. I argue in this paper that some analyses of emotion are more credible than others. Because this is so, the thesis that humans and nonhumans share emotions may well be a more difficult case to make than has been recognized thus far. Dixon is in philosophy, State University of New York, Plattsburgh. (E&E)

Dizard, Jan E., Going Wild: Hunting, Animal Rights, and the Contested Meaning of Nature. Amherst: University of Massachusetts Press, 1994. 182 pages. \$ 12.95 paper. Boston's water agency, the Metropolitan District Commission, owns and operates the Quabbin Reservoir and its watershed of 55,000 acres. The area is a preserve, and wildlife flourishes there. Deer flourish, welcomed for decades, but then overpopulate and begin to degrade the forest. The Commission opens the area to hunting, under controversial debate that moves across most of the key issues in environmental ethics: nature undisturbed by humans and the proper role of human management, whether nature can take care of itself in a reserve of this kind, whether hunting is an acceptable management tool, conservation and preservation. Chapter titles: What's Wild; Let Nature Be; Taking Care of Nature; Sport, Management or Murder, Ambiguity and Ambivalence in Modern Hunting; Nature's Rights and Human Responsibility; Constructing Nature. Dizard is in sociology and American studies at Amherst College. (v6,#4)

diZerega, Gus, "Social Ecology, Deep Ecology, and Liberalism," Critical Review 6 (nos. 2-3, 1992):305-370. Extensive critique of Murray Bookchin, representative of left environmentalism, from the author's perspective, which he calls "evolutionary liberalism." This involves an appreciative assessment of deep ecology. Bookchin attempts a social ecology that unites the leftist critique of liberal democratic society with contemporary environmental concerns. His work is undermined, however, in part by the dubious comparisons he makes between market systems and ecosystems, in particular by his failure to understand how these systems operate by impersonal principles of self-organization, combining both cooperation and competition. But the market system, whatever its merits, does promote an instrumental human relation to nature. Free market environmentalism cannot incorporate an appreciation for creatures that have intrinsic value but no instrumental value for human beings, nor for the intrinsic values of things that do have such instrumental value. Deep ecologists are therefore right to criticize the unwillingness of market societies to appreciate the intrinsic value of nature. This can be addressed with an evolutionary liberalism. Here property rights, for example, would be taken up with a sense of stewardship of values in the natural world. The deep ecological principle that should not be compromised is that property rights should reflect not just efficiency in meeting human desires, but also the value of the nonhuman world. We can achieve a harmony between humans and the natural world under the guidance of the rules of self-organizing systems. diZerega is with the Institute of Government Studies, University of California, Berkeley. DiZerega, Gus. "Individuality, Human and Natural Communities, and the Foundations of Ethics." Environmental Ethics 17(1995):23-37. An ecologically informed view of ethics focuses upon individuals considered in relation to the communities within which they live. Such a view holds that ethics is rooted in the fundamental relationships characterizing particular types of communities. From this perspective, the different communities of the polity, family, and ecosystem superficially appear to have very different ethical systems. In fact, however, all are characterized by respect for community members. Respect is the fundamental ethical insight. This view suggests a way of harmonizing modern society's relationship with the natural world and of bringing ethical theory into closer harmony with humankind's most timeless insights. Dierega is with the Foundation for Research for Economics and the Environment, Seattle. (EE)

Dobbins, Jeffrey C. "The Pain and Suffering of Environmental Loss: Using Contingent Valuation to Estimate Nonuse Damages." Duke Law Journal 43 (1994): 879-946. The various economic, philosophical, and legal arguments posed against the validity of contingent valuation will continue for some time to come. Despite uncertainties in contingent valuation methodologies, however, agencies and courts should permit contingent valuation to serve as one piece of evidence in the effort properly to assess the value of natural resource damages. The consistently positive response to contingent valuation studies and our own experience indicate that many of us do place a value on the mere existence of natural places and organisms. The difficulties involved in translating this value into monetary terms do not justify the complete rejection of a method that has the potential for reporting useful information. Although a significant body of criticism regarding the mechanics of contingent valuation methodology has been developed, caution in design and administration can resolve most of the difficulties. To the extent that even well-conducted contingent valuation studies remain doubtful, they involve questions regarding the appropriateness of inserting these sorts of cash values into the litigation and policymaking process. The decision then is a political, moral, and legal one. Are existence values the sorts of things that we consider an important part of natural resource damage recovery? Do we want to reduce such values to cash as a common denominator or does ethics reject common denominators as a vehicle by which values are compromised. (v6,#1)

Dobson, Andrew, "Drei Konzepte oekologischer Nachhaltigkeit" (article in german). Three conceptions of environmental sustainability. Natur und Kultur, Vol. 1/2, 2000, pp. 62-85. Abstract: The concept of environmental sustainability is usually approached either definitionally or discursively. Both these approaches have their limitations. Better is an analytical strategy revolving around the distillation from the literature of the questions to which any theory of environmental sustainability would have to have an answer. This produces a framework for analysis that can be transformed into a typology by grouping the

answers to those questions into "conceptions of sustainability". Two "diagnostic packages" are proposed for determining the causes of, and solutions to, unsustainability. (v.11,#4)

Dobson, Andrew, "Genetic Engineering and Environmental Ethics," Cambridge Quarterly of Healthcare Ethics (Cambridge University Press) 6 (1997):205-221. We can splice genes, but ought we to do so. Even to decide to do so some of the time assumes ethical decisions. Relevant factors include human welfare, but also the integrity (perhaps rights) of animals and plants. The really novel dimensions of environmental ethics, however, involve duties toward species, ecosystems, and even Earth. Genetic engineering (transgenics) differs from genetic selection (as in agriculture). Genetic engineering represents a quantum leap in terms of advances in manipulation that make possible practices of which we have no ethical experience. Genetic engineering could be the ultimate "technological fix". That we seek to patent the results of genetic engineering shows our sense of absolute ownership. Genetic engineering interferes with the "telos" of animal and plant life. One cannot treat the transgenic organism as the species from which it has been engineered. So far as genetic engineering results in a re-designed biosphere, it represents dissatisfaction with Earth as our home planet. Environmental ethics suggests establishing limits in unusual places, places that go to the heart both of genetic engineering and our relationship with the natural world. Dobson, Andrew, Citizenship and the Environment. New York: Oxford University Press, 2004. Ecological citizenship cannot be fully articulated in terms of the two great traditions of citizenship--liberal and civic republican. Dobson develops a "post-cosmopolitan" theory of citizenship and argues that ecological citizenship is an example and an inflection of it. Ecological citizenship focuses on duties as well as rights, and these duties are owed non-reciprocally by those individual and communities who occupy unsustainable amounts of ecological space to those who occupy too little.

Dobson, Andrew, "Nature (and Politics)," *Environmental Values* 17(2008):285-301. This paper addresses the leitmotif of Alan Holland's work, which is argued here to be a defence of the existence and worth of nonhuman nature. Definitions of politics have always depended on the idea of nature as a contrasting non-political realm, usually turning on the centrality of speech. Referencing the work of Aristotle, Kant and Bentham, I suggest that the instability of the distinction between the human and the nonhuman means that politics, as 'thing and activity', must itself be unstable. The question of whether there can be a politics without nature is explored through an analysis of the work of Latour, and the conclusion is reached that listening may well be just as important as speaking.

Dobson, Andrew. "Biocentrism and Genetic Engineering." *Environmental Values* 4(1995):227-239. I consider the contribution that a biocentric perspective might make to the ethical debate concerning the practice of genetic engineering. I claim that genetic engineering itself raises novel ethical questions, and particularly so when confronted with biocentric sensibilities. I outline the nature of these questions and describe the biocentric basis for them. I suggest that fundamentalist opposition to projects of genetic engineering is unhelpful, but that biocentric claims should now be a feature of ethical consideration. I conclude, though, that while environmental ethicists can contribute powerfully to debates concerning the future of genetic engineering, the ultimate direction it takes is likely to be beyond their control. KEY WORDS: Environmental ethics, biocentrism, genetic, engineering, species. Dobson is in the politics department, Keele University, UK. (EV)

Dobson, Andrew. "Deep Ecology." *Cogito* 3:1 (1989): 41-46. This article begins as an introduction to the basic ideas and problems of deep ecology, but then concludes with the criticism that deep ecology is too concerned with philosophical speculation and contemplation to develop a meaningful political praxis. The lack of political involvement is an important criticism, since deep ecologists often answer their philosophical critics with the claim that deep ecology is a political movement, not a doctrine. Dobson identifies two strands of deep ecology: the search for intrinsic value and the alteration of consciousness, but only the second is generally identified with deep ecology. A reply to Dobson was written by Robin Attfield, "Deep Ecology and Intrinsic Value: A Reply to Andrew Dobson," *Cogito* 4:1 (1990). (Katz, Bibl # 2)

Dodds, Walter K., "The Commons, Game Theory, and Aspects of Human Nature that May Allow Conservation of Global Resources," Environmental Values 14(2005): 411-425. Fundamental aspects of human use of the environment can be explained by game theory. Game theory explains aggregate behaviour of the human species driven by perceived costs and benefits. In the 'game' of global environmental protection and conservation, the stakes are the living conditions of all species including the human race, and the playing field is our planet. The question is can we control humanity's hitherto endless appetite for resources before we irreparably harm the global ecosystem and cause extinction of even more species? The central problem is that some proportion of the individuals or groups will behave selfishly. The inducement for using more than a fair share, or 'cheating', increases as that resource becomes rarer, thus the benefits of cheating increase. In addition, the total number of people is increasing, so the proportion of cheaters must decrease to even keep total resource use constant. Cost benefit analysis of the effect of regulation and incentives on potential cheaters may provide a rational approach to controlling environmental problems. While it is debatable that environmental values are constant across cultures, communal use of resources seems to follow global rules. Cooperative use and punishment of those who use more than their share appear to be ubiquitous in human societies. Schemes for controlling human impact on the global environment must take into consideration basic behaviours including development of social norms and the positive feedback created because resources become more valuable with increasing rarity leading to more incentive for consumption. Dodds is in biology, Kansas State University, Manhattan, KS. (EV)

Dodds, WK; Gido, K; Whiles, MR; Fritz, KM; Matthews, WJ, "Life on the Edge: The Ecology of Great Plains Prairie Streams", BioScience 54 (no.3, 2004): 205-216(12). Great Plains streams are highly endangered and can serve as model systems for studying disturbance ecology and related issues of resistance and resilience in temperate freshwaters. The future for Great Plains streams is bleak, given the land-use changes and water-use patterns in the region and the large areas required to preserve intact, ecologically functional watersheds.

Doeleman, J. A. "On the Social Rate of Discount: The Case for Macroeconomic Policy." Environmental Ethics 2(1980):45-58. Concern for the rapidly growing scale and intensity of the human exploitation of the environment, in particular the alienation of natural ecosystems, but also resource exhaustion, pollution, and congestion, leads one to wonder about the short time horizons allowed for in decision making. Time preference is dictated by the rate of interest, allowing in practice a horizon often not exceeding several decades. I argue that this is unsatisfactory. Some minimal social rate of discount should not be enforced. Instead, it is more feasible to set absolute environmental standards, thereby introducing quantity constraints on our decision making, within which time preference can be permitted to find its own level. This acknowledges that the myopia of human vision may not be a flaw but rather a biological design which has served us well in evolution. It may, therefore, be better to change the rules by introducing self-imposed collective constraints than to try to change the shortsightedness of people in their day-to-day grass-roots decision making. Doeleman is in the department of economics, University of Newcastle, New South Wales, Australia. (EE)

Dolezal , Joshua A., "Literary Activism, Social Justice, and the Future of Bioregionalism ," *Ethics and the Environment* 13(no. 1, 2008):1-22. Whereas the political battle between literary activists and industry over the tenets of bioregionalism in the American West has ignored the question of social justice, effectively silencing a sizeable population—the working poor—by creating an economic situation in which labor must choose between two oppressors, mutual aid as championed by Petr Kropotkin offers more potential for reform than the model of political competition has yielded thus far. If literary activists were to extend Jared Diamond's call to social action in *Collapse* by becoming advocates of laborers injured by industrial catastrophes, and if eco-activists were to imagine economic alternatives to the policies they oppose, then bioregionalism could hope to gain more ground as a grassroots movement. Dombrowski, Daniel A., Not Even a Sparrow Falls: The Philosophy of Stephen R. L. Clark. East Lansing: Michigan State University Press, 2000. Clark, argues Dombrowski, is a brilliant and overlooked philosopher. Clark ranges widely over the philosophy of religion and over the human treatment of animals, as well as social philosophy. A synthesis of both is challenging, especially as Clark is sometimes locally obscure but globally clear. Three parts of the book analyze: (1) God, (2) animals, and (3) polis. Clark's dipolar theism has awesome originality, if also problems. Clark's treatment of animals places them in a theistic metaphysics. True community differs from mere society, the latter is the lair of liberalism. In the formation of true community, Clark returns to religion. Clark will eventually be seen as a philosopher who is very important for our generation, but the furious intensity of some of Clark's polemics as well as the broadness of some of his brush strokes sometimes get in the way of our ability to appreciate his greatness as a thinker. Dombrowski is at Creighton University. (v.13,#2)

Dombrowski, Daniel A., "Bears, Zoos, and Wilderness: The Poverty of Social Constructionism," Society and Animals 10(no. 2, 2002):195-202. Dombrowski is in philosophy, Seattle University, WA. Defends Holmes Rolston's realism vs. social construction, using bears in zoos as a case in point. There is a difference between a bear in a zoo and a bear in the wild. This difference legitimates the belief that the former is an attenuated version of the latter. The danger posed by a bear in the wild is not due to an overly active imagination. The experience of sublime beauty (in contrast to mere cuteness) in the presence of a wild bear is only partly of one's own doing. Although our frameworks (theories, zoos, etc.) are social constructs, the real world against which we test and evaluate them is not a social construct. Good zoos are better than bad ones, but naturalistic zoo environments for bears are not nearly natural ones, no matter what social constructionists may say about the matter. Dombrowski is in philosophy, Seattle University, WA.

Domsy, Darren, "Keeping a Place for Meta Ethics: Assessing Elliot's Dismissal of the Subjectivism/Objectivism Debate in Environmental Ethics," Metaphilosophy 35 (5), (October 2004): 675-94. Robert Elliot claims that the meta ethical distinction between subjectivism and objectivism is unimportant in environmental ethics. He argues that because a sufficiently sophisticated subjectivist can accommodate all of the intrinsic value an objectivist can, even in apparently problematic situations where humans either do not exist or do not have the relevant values, and because meta ethical commitments fail to have any normative or motivational impact on rational debate, it makes no difference whether an environmental ethicist is a subjectivist or an objectivist. Elliot's dismissal, however, is unjustified. As it

turns out, objectivists argue differently than subjectivists, are motivated differently than subjectivists, and are able to make a greater range of intrinsic value claims than subjectivists. If Elliot's arguments have any appeal at all, it is only because he blurs the fundamental meta ethical distinction in the first place and defends a subjectivism so objectivist that it is almost unrecognizable as subjectivism. Domsy is visiting assistant professor of philosophy at Auburn University, Alabama.

Domsy, Darren. "The Inadequacy of Callicott's Ecological Communitarianism." Environmental Ethics 28(2006):395-412. J. Baird Callicott defends a communitarian environmental ethic that grounds moral standing in shared kinship and community. This normative theory is unacceptable because it is out of synch with our considered moral judgments as environmental philosophers. Ecological communitarianism excludes in advance entities that would obviously qualify for moral standing, and scuttles itself in the process. (EE)

Domsy, Darren. "Evaluating Callicott's Attack on Stone's Moral Pluralism1," Environmental Values 10(2001):395-415. J. Baird Callicott is well known in environmental philosophy for his attack on Christopher D. Stone's moral pluralism. Although his attack has drawn attention from critics and has been labelled problematic for various reasons, I argue that it fails entirely. Each of Callicott's three distinct criticisms proves to be not only weak on its own terms, but, perhaps surprisingly, as effective against Callicott's own communitarian position as it is against Stone's pluralist one. I show that Callicott's attack is not only wholly ineffective in targeting Stone, but that even if it were so effective it would on every count be just as effective in targeting its own originator. Keywords: J. Baird Callicott, Christopher D. Stone, moral pluralism, communitarianism, ethical monism, environmental ethics. Donato, D. C., et al., "Post-Wildfire Logging Hinders Regeneration and Increases Fire Risk," Science 311(20 January 2006):352. Postfire or salvage logging is often claimed not only to use such wood economically but also to reduce further fire risk; it may also be claimed that forests will not adequately regenerate without intervention. But these authors find the opposite, studying regeneration after the 2002

Biscuit Fire, Oregon, in a largely Douglas fir forest, where some areas were salvage logged and others not. Unexpectedly, by disturbing the soil, salvage logging reduced conifer seedling regeneration by 73 percent. Also loggers left behind brush and added kindling to the forest floor, making low level surface fires more likely. The authors are largely with the Department of Forest Science, Oregon State University. But the article produced a fire at Oregon State, when another group of faculty members (and some from the U.S. Forest Service) tried to delay print publication claiming that the article had serious shortcomings. Donlan, Josh, et al (half a dozen, including Dave Foreman, Michael Soulé), "Re-wilding North America," Nature 436 (18 August, 2005): 913-914. Bring back the Pleistocene. A plan to restore charismatic megafauna (horses, camels, asses, cheetahs, elephants, lions) that disappeared 13,000 years ago from Pleistocene North America, proposed as an alternative conservation strategy. Where the megafauna to be restored no longer exist elsewhere in the world, closely related proxies will be used--as with the elephants and lions. The plan starts small and is experimental and incremental (for example, with reintroduction of the Bolson tortoise, which can weigh 100 pounds, once common in the U.S. and now found rarely in Mexico). Next step might be on some (well-fenced) 200,000 acre private ranch in the U.S. Southwest.

--Engel, J. Ronald, "The Faith of Democratic Ecological Citizenship"

Articles are products of a four-year symposium of ethicists and Chicago civic leaders on long-term responsibilities to humans and nature in the Chicago metropolitan region. The key ethical concept proposed is that of "democratic ecological citizenship" understood within an evolutionary and ecological conceptual framework. (v.10,#1)

Donnelley, Strachan, Charles R. McCarthy, and Rivers Singleton, Jr., "The Brave New World of Animal Technology," Hasting Center Report 24, no. 1 (1994), special supplement, pages S1-S31. New

biotechniques manipulate the very character of animal being, with the power to alter nature radically. Are these manipulations ethically legitimate? Biotechnological manipulations threaten the fundamental character of animal species that have arisen in historically deep evolutionary and ecological contexts. Like the recombinant DNA technology that preceded them, transgenic organisms are probably unbounded in potential application. However, from a strictly scientific perspective, there seems to be nothing radically novel about transgenic organisms. Humans have bred animals for millennia. All living organisms are in an evolutionary sense transgenic to the extent that they share common genes. My dog and I share common genetic information. But modern technology allows us to accelerate the process of genetic diversification and to cross much broader evolutionary boundaries.

Individually and collectively we do not live in a single morally harmonious world, rather we confront an ineradicable moral plurality, each claiming attention and not readily coordinated with the others. In much science, there is no serious concern with the moral significance of animals, thought to be without intrinsic value. But there is sometimes a conviction that natural systems run to their own amoral rhythms that for pragmatic reasons we should not significantly undermine. Also, there is growing a direct moral concern for intrinsic values in these forms of life. Nature in a crucial sense is the all-inclusive domain of domains, the context of contexts, and what must finally be protected. Nevertheless, nature is no realm of essentialist perfection. Rather, our biosphere is an extraordinary, historically particular and "chaotically orderly" realm of dynamic and systemically related "imperfections"; individual organisms more or less well-adapted to worldly life, changing in evolutionary/ecological time. We should understand ourselves and our embedded existence in an animate nature that is ultimately significant, yet imperfectly good. The authors are with the Hastings Center.

Donner, Wendy, "The Self and Community in Environmental Ethics," pages 375-389 in Warren, Karen J., ed., Ecofeminism: Women, Culture, Nature (Bloomington, IN: Indiana University Press, 1997). "The critique of reason, rationality, and universal principles as male concepts is a familiar theme in many environmentalist, feminist, and ecofeminist writings. This critique rarely sorts out the forms of rationality and universalizability that are of legitimate concern for feminists and environmentalists from those that are valuable or essential to retain. ... It makes no more sense to condemn rationality in general because it has been ill used to attempt to justify domination and aggression than it makes sense to condemn emotion in general because hate and hatred have been the impetus for genocide and torture." Donner is in philosophy at Carleton University in Ottawa. (v.9,#4)

Donner, Wendy. "Inherent Value and Moral Standing in Environmental Change," pages 52-74 in Hampson, Fen Osler, and Reppy, Judith, Earthly Goods: Environmental Change and Social Justice (Ithaca, New York: Cornell University Press, 1996). Donner criticizes the animal rights/welfare theories of Tom Regan and Peter Singer; the land ethic of Aldo Leopold and J. Baird Callicott; deep ecology; and the ecofeminism of Karen Warren, Val Plumwood, and others. Regan and Singer do not have an environmental ethic, only an ethics for using the environment to satisfy the preferences of sentient animals, including humans. Of Callicott's land ethic: "The result is an uneasy mixture that neither quells the concerns of critics nor provides clear guidelines for cases of conflict" (p. 61). "Thus there are serious problems with the land ethic: an analysis of value that does not support the value claims of the theory; a lack of guidance on how weightings of very different elements are to be carried out; and decisions that are troubling at best, horrifying at worst" (p. 65).

Of ecofeminism: "Consensual decision is ... welcome when it works. But when consensus does not work, and we are faced with genuine and painful conflict, then ecofeminism provides little guidance in particular cases if the conflicting claims are all seen as being of equal value" (p. 69). "Can one who

has serious concerns for the well-being of the environment trust the human capacity to care more than the human capacity to reason and value? (p. 70). Deep ecology has an unworkable concept of a self indistinguishable from the environment. Environmental ethics needs a concept of self-in-relationship. "There is no fusion of two into one but a complement of two entities acknowledged as separate, different, independent, yet in relationship" (quoting Karen Warren) (p. 74). Donner teaches philosophy at Carleton University in Ottawa. (v8,#1)

Doogue, Edmund, "Poverty's Toll" (Report on the UN World Summit for Social Development, March 1996 in Copenhagen), One World (Geneva, Switzerland, World Council of Churches) No. 205, May 1996, pages 4-6. From UN figures, twenty percent of the world's population, the world's richest people, own almost 83 percent of the world's wealth and another twenty percent, the world's poorest people, own only 1.4 percent of the world's wealth. Over the past 30 years, the distribution of wealth has become more unequal. The Summit produced many resolutions and demands for reform, but "the check came back from the bank of justice marked 'insufficient funds.'"

Dore, Mohammed H. I., "The Problem of Valuation in Neoclassical Environmental Economics," Environmental Ethics 18(1996):65-70. In this paper I argue that the criterion of valuation in neoclassical economics is flawed because it is not an invariant measure of value. It is invariant only when unrealistically restrictive conditions are imposed on the class of admissible utility functions, which in fact makes it a special case. The only sensible alternative is to turn to classical value theory based on real sacrifices or opportunity costs. Dore is in economics, Brock University, Ontario, Canada. (EE)

Dower, Nigel, "Does Global Citizenship Require Modern Technology?" CPTS Ends and Means (Journal of the University of Aberdeen Centre for Philosophy, Technology and Society), 5(no. 1, spring 2001): 9-24. Yes and no, with a lot of highly contentious issues in between. Yes, if one seeks to be someone who can effectively exercise global responsibility in the modern world. No, if (like Stoics of old, without technology) one has a conception of self identity and human being that accepts a global citizenship. "Modern technology is necessary for the actualisation of the idea of global citizenship in the modern world (though it is not necessary for the idea itself)" (p. 11). "Global citizenship then requires modern technology, not in the sense of needing it as it is, but in the sense of its being grounded in the facts of modern technology. We have seen this in at least three ways: as the causal context of our global problems, as that which enables global citizenship to be effectively expressed in action, but also as something to be controlled, modified and developed in the light of our global values. Perhaps we could conclude by saying that technology needs a global human face, but at the same time that global citizenship needs a flexible but strong technological backbone" (p. 24) Dower is in philosophy, University of Aberdeen, Scotland. (v.12,#3)

Dower, Nigel, "Worth Sustaining? Reply to Attfield and Wilkins." Environmental Values 3(1994):159-160. Robin Attfield and Barry Wilkins take me to task for suggesting that 'sustainable' means 'worthy of being sustained'. The burden of their criticism is that in defining it this I am making it cover too much and thus robbing 'sustainable' of its normal and serviceable meaning 'capable of being sustained'. What I meant to convey, but now I realize did not make clear enough, was that 'sustainable' in the evaluative sense was not a rival or substitute sense but an additional sense. Dower is at the Department of Philosophy, University of Aberdeen, U.K. (EV)

Dower, Nigel, World Ethics - The New Agenda. Edinburgh: University of Edinburgh Press, 1998. As world citizens we have duties that are global in scope and the relations between states should be governed by this cosmopolitan ethic. Dower (a) explores the nature of world ethics, by identifying the different ways of thinking about ethics which underlie both the rejection of world ethics and the endorsement of it; (b) defends a normative cosmopolitan theory that steers a middle way ("solidarity with diversity") between traditional objectivism and a modern "liberal" paradigm; (c) applies the theory to war and peace,

world poverty, the environment and the United Nations.

Dower, Nigel. "Human Development - Friend or Foe to Environmental Ethics?"

Environmental Values 9(2000):39-54. ABSTRACT: This article is premised on the assumption that in order for us adequately to protect our environment, significant adjustments need to be made to the ways we pursue and think about development - adjustments not merely to technologies but also to life-styles. In this respect the emphasis in much recent development literature on human development is to be welcomed as a useful corrective to definitions of development in terms of economic growth, though there is still a danger of anthropocentric assumptions. It is argued that, given suitable interpretations or conceptions of development and environment, environmental care can be, and should be, integrated into authentic human development. Proposals for such conceptual alignment stem both from seeing the relevant community in which development qua desirable change is to take place as the biotic community, and from seeing development as desirable change in the total environment, both natural and artificial, regarded as a social field of significance. Such conceptual adjustments are a significant part, but of course only a part, of what needs to be done to bring public policy more into line with proper care for the environment. KEYWORDS: community, development, environment, evaluation, field of significance, growth, human, rationality, sustainability. Dower is in the Department of Philosophy University of Aberdeen, U.K. (EV)

Dower, Nigel. "Biotechnology and the Third World," CPTS Ends and Means 1 (Autumn 1996): 26-31. This is a journal published by the Centre for Philosophy, Technology, and Society, Aberdeen (Scotland) University, also available as an electronic journal. Several issues are identified regarding biotechnology and the third world: (1) Import substitution, (2) promotion of new genetically engineered seeds or animals which creates dependency in farmers using them, marginalizes farmers who do not, and threatens biodiversity, (3) Northern dominance in the global economy, reinforced by the patent system, (4) expropriation of genetic material from the Third World and then the return of it with value-added to the Third World. Dower is in philosophy at the University of Aberdeen. (v.8,#4)

Dower, Roger, Ditz, Daryl, Faeth, Paul, et al., Frontiers of Sustainability, Environmentally Sound Agriculture. Washington, D.C.: World Resource Institute, 1997. 415pp. \$35.00 paper. The authors examine environmental performance and trends in four key economic sectors: agriculture, electricity generation, transportation, and pulp and paper manufacturing. They map out the implications of potentially dangerous developments and detail methods for reducing or managing these threats without inhibiting American technical and economic prowess. (v8,#1)

Dower, Roger; Ditz, Daryl; Faeth, Paul; Johnson, Nels; Kozloff, Keith; and MacKenzie, James. Frontiers of Sustainability: Environmentally Sound Agriculture, Forestry, Transportation, and Power Production. Washington, DC: Island Press, 1997. Tables, figures, index. 415 pages. \$ 34 U.S. paper. ISBN 1-55963-546-0. The authors are researchers at the World Resource Institute, and their essays build on the recommendations of the President's Council for Sustainable Development. All analyses are new and interdisciplinary. Much-needed rules and measurements are presented regarding progress toward sustainability for the U.S. The book is aimed at environmental professionals; business people who work in agriculture, forestry, transportation, and power production; students; and federal, state, and local policymakers. (v.8,#4)

Dowie, Mark, Losing Ground: American Environmentalism at the Close of the Twentieth Century. Cambridge, MA: MIT Press, 1995. 317 pages. \$25. Dowie argues that the national environmental movement is risking irrelevance because the people leading its largest organizations are too white, too male, too elite, too polite, and too involved with Washington. For instance, CEOs often sit on boards of environmental organizations like the National Wildlife Federation and the Sierra Club. The environmental movement is losing its strong grassroots support. The so-called Wise Use Movement--a loose coalition of property owners, ranchers, small-business executives, and municipal officials--has gained considerable clout with the grassroots. "American land, air, and water ... would be in far better condition had environmental leaders been bolder, more diverse in class, race, and gender; less compromising in battle; and less gentlemanly in their day-to-day dealings with adversaries." For a contrasting book, published at the same time, see Easterbrook, Gregg, A Moment on the Earth. Dowie is a former editor and publisher for Mother Jones magazine. (v6,#2)

A concise handbook that lists and illustrates key principles in the field, and presents specific examples from around the world of how those principles can be applied across a range of scales and diverse types of landscapes. (v7,#4)

Draney, Michael L., "Ethical Obligations toward Insect Pests," Ethics and the Environment 2(no. 1, 1997):5-23. This paper examines the implications of considering the values and rights of insect pests in determining which insect control efforts to pursue. This consideration will depend on the scale of the control effort, that is, whether the control operates at the level of individual pest organisms, populations, or the entire pest species. I argue that an individual organism's rights cannot be taken into account in planning insect control, because of the practical impossibility of granting it anything but infinitesimal moral significance. However, in harming populations of insects, numbers become important and effects on local ecosystems should be considered. Given this, it still may be right to control or even eliminate a population if its negative value to humans is sufficiently high in relation to its ecological value. Eradication of a species involves irrevocable loss. I propose that species are unique individual entities (as opposed to abstract classes of organisms) and that our ethical obligations to insect pests lie in acknowledging the right of these species to continued, if controlled, existence. At this level, they must receive moral consideration in any actions taken. Draney is in the Ph.D. program in entymology at the University of Georgia. (E&E)

Draper, AE, "Conservation Easements: Now More Than Ever-Overcoming Obstacles to Protect Private Lands," Environmental Law 34(no.1, 2004):247-282. (v. 15, # 3)

Draper, Elaine, Risky Business. Cambridge, UK: Cambridge University Press, 1991. Many persons in industry are currently arguing that certain environmental toxic substances are not hazardous in general, but hazardous only to particularly susceptible individuals. Hence they argue for genetic screening to avoid hiring genetically susceptible individuals, instead of lowering work-place exposure to toxic chemicals. Draper argues against this view and, in an excellent book, takes on the entire chemical industry.(v3,#2)

Draper, Elaine, Risky Business (New York: Cambridge University Press, 1991). This is a study in occupational diseases, caused by industrial environments that put employees at risk. Draper, a sociologist, claims there is what amounts to "genetic testing" in the workplace. She analyzes the

fundamental underlying reasons, social and economic, for this phenomenon. Chemical corporations are aware of the high cost of litigation and compensation when employees are harmed on the job, those who manufacture and transport chemicals. So they attempt to screen those who are more susceptible and deny them employment. This can include women who are, or may become, pregnant. (v3,#3)

Dreifus, Claudia, "Friends Matter for Reclusive Creature of African Forest," New York Times, October 12, 2004, p. D4. The rare and endangered okapi in eastern Congo. An okapi is quite small, has the hindquarters of a zebra, the body of an antelope, and the face of a giraffe. It is quite elusive, shy, lives in deep forests, and looks like something you wouldn't believe. The Wildlife Conservation Society in Congo seeks to preserve them. (v.14, #4)

Dreifus, Claudia, "A Conversation with Luis F. Baptista: A Birdman Ponders the Songs of Sparrows," New York Times (5/16/00). Aesthetic sense of birds and humans are similar. Luis Baptista, curator of ornithology for the California Academy of Sciences, claims that "we can actually show that birds have an aesthetic sense similar to ours. If you take female great reed warblers, stick them with female hormones, put them in a soundproof box and play for them recordings of male songs--some beautiful and some yuckie--you will see that they solicit copulation more from the beautiful songs than the yuckie ones. That means that the females actually prefer beautiful songs, even what humans consider beautiful." Woodpeckers are "instrumentalists": They peck for bugs but also to "make music because they don't have vocal songs like song birds." They find a log that makes the correct sound and then pound on it with a specific rhythm. Hermit thrushes sing in the pentatonic scale used in Far Eastern music and the canyon wren sings in the chromatic scale. Baptista also suggests that birds sometimes sing for pleasure, if they are well fed and relaxed. Birds communicate messages with sound as well. Chickens, if shown a picture of a racoon, will make a clucking sound quite different from the sound that they make when shown a picture of a falcon, and other chickens will look around or up depending on the sound. Bird dialects, Baptista argues, are determined by what sound will carry best in the bird's home environment: Oak forest bird songs carry farther in oak forests than in coniferous forests (and vice versa for songs produced by birds that live in coniferous forests). (v.11,#2)

Drengson, Alan R. Review of Deep Ecology. By Bill Devall and George Sessions. Environmental Ethics 10(1988):83-89.

Drengson, Alan R. "Technocratic versus Person-Planetary." Environmental Ethics 4(1982):93-94. (EE)

Drengson, Alan R. "A Critique of Deep Ecology? Response to William Grey." Journal of Applied Philosophy 4 (1987): 223-227. A response to a criticism of deep ecology by William Grey, "A Critique of Deep Ecology," Journal of Applied Philosophy 3 (1986): 211-216. Drengson emphasizes that the purpose of deep ecology is a broadening of consciousness and the creation of new paradigms for understanding our relationship to nature. (Katz, Bibl # 2)

Drengson, Alan R. "Shifting Paradigms: From the Technocratic to the Person-Planetary." Environmental Ethics 2(1980):221-40. In this paper I examine the interconnections between two paradigms of technology, nature, and social life, and their associated environmental impacts. The dominant technocratic philosophy which now guides policy and technological power is mechanistic. It conceptualizes nature as a resource to be controlled fully for human ends and it threatens drastically to alter the integrity of the planet's ecosystems. In contrast, the organic, person-planetary paradigm conceptualizes intrinsic value in all beings. Deep ecology gives priority to community and ecosystem integrity and seeks to guide the design and applications of technology according to principles which

follow from ecological understanding. I describe this shift in paradigms and how it affects our perceptions, values, and actions. Drengson is in the department of philosophy, University of Victoria, Victoria, B.C., Canada. (EE)

Drengson, Alan R., Beyond Environmental Crisis: From Technocrat to Planetary Person. New York: Peter Lang, 1989. Pp. xii, 259. Drengson is editor of The Trumpeter, a journal of ecophilosophy with an emphasis on deep ecology. This book is a greatly revised version of Drengson's 1983 text, Shifting Paradigms: From Technocrat to Planetary Person. It is a detailed exploration of the process of ecophilosophy, illustrating how a committed individual can develop an ecological "planetary" consciousness. Drengson combines scholarly philosophical literature with ecological thought, philosophy of technology, and Eastern philosophy to present a method for the transformation of consciousness. This book is not the presentation of a system, nor an argument for its acceptance, but an analysis of the deepest structures of Western thought that have engendered the environmental crisis. "The fundamental purpose of this book is to exemplify a philosophy of appropriate philosophizing as both a pure and applied art that can be practiced as a way to the realization of The Way, which is not only the Way of Nature but the great spiritual path taught as the core of all authentic paths" (p. 5). The strength of the book is an analysis of the dominant technological paradigm in which Western society is embedded. Even for those unwilling to follow Drengson on "the way," the critical analysis of contemporary consciousness is extremely worthwhile. Contains an excellent bibliography and a series of appendices that provide accessible charts and diagrams of the main points. (Katz, Bibl # 2)

Drenthen, Martin, Bordering wildness; The desire for wilderness and the meaning of Nietzsche's critique of morals for environmental ethics. [In Dutch: Grenzen aan wildheid: wildernisverlangen en de betekenis van Nietzsches moraalkritiek voor de actuele milieu-ethiek] 2003 Budel: Damon, Dissertation (University of Nijmegen) With a summary in English (page 313-316). Full text version is available online at: http://webdoc.ubn.kun.nl/mono/d/drenthen_m/grenaawi.pdf

Environmental ethicists, each in their own way, struggle with the moral sense of nature. Whether or not this is explicitly admitted, each normative position within the debate turns out to rely on a particular normative concept of nature. However, the use of any of these particular normative interpretations cannot be legitimized. The starting point of this inquiry is the assumption that today's environmental crisis is intrinsically related to this ambiguity with regard to the normative meaning of nature. This ambiguity has a foundational character, and the conflicts and dilemmas that stem from it cannot be solved easily.

In order to clarify this relation between the environmental crisis and the crisis in morality, we analyze the relation between nature and morality in the work of the late 19th century German philosopher Friedrich Nietzsche, and ask whether his philosophy can help us clarify the problematic relationship between nature and morality in contemporary environmental ethical debates.

From Nietzsche's viewpoint, environmental ethics appears as a paradoxical undertaking, on the one hand, interested in nature in so far as it transcends human seizures of power (wildness as a critical concept), on the other hand restricted in its possibility to model this interest on anything else than yet another interpretative appropriation. That is to say, we can only articulate the moral significance of nature "itself" by interpreting it, but each interpretation inevitably implies a moment of appropriation. However, some environmental ethicists appear to do more justice to this profound problematic character of our relationship with nature by explicitly acknowledging the inaccessibility and radical otherness of wild nature. The newly developed perspective is tested on its fruitfulness for the Dutch case of "new nature development". In this debate on ecological reconstruction, the concept of wildness functions as a moral concept, albeit a paradoxical one. This idea of wildness is hermeneutically elaborated. In a time where "real" wildernesses no longer seem to exist, we are fascinated by the idea of wildness as something beyond our ability to control and appropriate. Wildness thus poses a (moral) limit to human appropriations of nature, it is a critical border concept that puts the human, moral order in perspective.

Drenthen, Martin, "De natuur als strijd van interpretaties [Nature as a struggle of interpretations; on the relation between nature and morality in the work of Friedrich Nietzsche]." In: Al het goede uit de natuur: Ethiek op de tweesprong tussen zijn en behoren. CEKUN-cahier 4, CEKUN, Nijmegen 1998, pp. 23-36. Nietzsche's philosophy shares a common characteristic of ancient stoic philosophy in the sense that it does not presuppose a distinction between facts and values. (v.11,#1)

Drenthen, Martin, "Maakbare natuur, waanzinnige oase of wonderlijke wereld? [Makeable nature, wild oasis or wonderful world?]." In: H. Geerst (ed.) Maakbaarheid, macht en matigheid (Annalen van het Thijmgenootschap). Nijmegen: Valkhof Pers, 1998, pp. 41-46. I argue that both proponents and opponents of environmental restoration--the reconstruction of "natural landscapes" in the Netherlands--share a common concept of nature in which nature is defined as absence of human activity. In the work of the Dutch writer Koos van Zomeren, however, a concept of nature can be discerned, in which nature is fully penetrated with stories, meanings, histories and plays as such a key role in human life. (v.11,#1)

Drenthen, Martin, "Onze schizofrene benadering van de natuur [In Dutch: Our schizophrenic approach to nature; On sustainability, science and conceptions of life], in: V. Poels (eindred.), Het milieu als

offerplaats; Over milieuproblematiek, levensbeschouwing en duurzame ontwikkeling, Damon, Best 1998, pp. 195-219. I argue that we can only understand the factual use of the notion of sustainability within political debates on environmental issues, when we take into account the different moral meanings of "nature" that are implied in the different worldviews and conceptions of good life. A distinction should be made between an anthropocentric use of the term sustainability, where nature is seen as a limited resource that should be saved for future generations, and a second, more vague use of the term, that has a more "non-anthropocentric" character. In this second approach, nature is seen as a moral framework: to live in a sustainable way, means to live in accordance with the "way of nature", to respect the rhythm of nature and so on. I show that this second type of moral reasoning has become problematic in our pluralistic age. On the other hand, I argue, the modern approach to these kinds of moral experiences, in which these experiences are treated as if they only reflect singular, subjective individual preferences, does not articulate these experiences adequately. Understanding the different moral meanings of nature that factually play a role in current debates, requires an openness for the factual ambivalence of our moral experiences of nature. (v.11,#1)

Drenthen, Martin. "The Paradox of Environmental Ethics: Nietzsche's View of Nature and the Wild." Environmental Ethics 21(1999):175. In this paper, I offer a systematic inquiry into the significance of Nietzsche's philosophy to environmental ethics. Nietzsche's philosophy of nature is, I believe, relevant today because it makes explicit a fundamental ambiguity that is also characteristic of our current understanding of nature. I show how the current debate between traditional environmental ethics and postmodern environmental philosophy can be interpreted as a symptom of this ambiguity. I argue that, in light of Nietzsche's critique of morality, environmental ethics is a highly paradoxical project. According to Nietzsche, each moral interpretation of nature implies a conceptual seizure of power over nature. On the other hand, Nietzsche argues, the concept of nature is indispensable in ethics because we have to interpret nature in order to have a meaningful relation with reality. I show that awareness of this paradox opens a way for a form of respect for nature as radical otherness. (EE)

Drenthen, Martin. "Het zwijgen van de natuur [in Dutch: The silence of nature]," Filosofie & Praktijk 17/4 (winter 1996), pp. 187-199. The environmental philosophical community in the Netherlands is being divided by a controversy between postnaturalistic postmodern constructivism and a more phenomenology-oriented, hermeneutic approach to nature. I show that the postmodernist critique of traditional environmental philosophy rightfully points to a problem that until recently has been neglected by Dutch environmental philosophers: the problem that there exist a plurality of normative notions of nature. Next, I show that the postnaturalistic position itself rests on a contradiction. Postnaturalism claims neutrally to facilitate the democratic debate between different normative approaches to nature, but in fact, itself implicitly presupposes a particular (modern) concept of nature, that is: it favors one of the voices within the debate. Finally, I argue that these controversies are the inevitable result of a fundamental ambiguity within our current moral understanding of nature, that should be reflected adequately. Drenthen is philosopher at the Center for Ethics of the University of Nijmegen, the Netherlands. (v.11,#1)

Drenthen, Martin. "Nietzsche and the Paradox of Environmental Ethics: Nietzsche's View of Nature and Morality." *New Nietzsche Studies* Vol. 5, no. 1/2 (2002): 12-25. This is a slightly adapted version of "The Paradox of Environmental Ethics: Nietzsche's View on Nature and the Wild" (*Environmental Ethics* Vol. 21, no. 2 (1999): 163-75).

Drenthen, Martin. "New Wilderness Landscapes as Moral Criticism: A Nietzschean Perspective on our Fascination with Wildness." *Ethical Perspectives* Vol. 14, no. 4 (2007): 371-403. In moral debates about the human relationship with nature, one often hears references to nature's wildness. Apparently, postmodern city dwellers seem to be deeply fascinated by wild nature; for them, wildness somehow seems to have strong moral significance. How should we interpret this fascination? Moral meanings of

nature come into play as soon as we start articulating our relationship with the world. In this process, we transform the neutrality of space into a meaningful place; that is, through interpretation we make mere environment into a meaningful and inhabitable world that we can live in. However, there is something peculiar with experiences of wild nature that seems to go beyond this hermeneutical framework. The word "wilderness" refers to the sphere that lies beyond culture, a part of the world that is not subject to human intervention and that is not (and can never be made) our home. Does this mean that wildness cannot be part of a meaningful world? Drenthen argues that Nietzsche's account of nature can help elucidate today's fascination with (the value of) wilderness as a place of value beyond the sphere of human intervention.

Drenthen, Martin. "Wildness as a Critical Border Concept: Nietzsche and the Debate on Wilderness Restoration." *Environmental Values* Vol. 14, no. 3 (2005): 317-37. How can environmental philosophy benefit from Friedrich Nietzsche's radical critique of morality? In this paper, Drenthen argues that Nietzsche's account of nature provides us with a challenging diagnosis of the modern crisis in our relationship with nature. Moreover, his interpretation of wildness can elucidate our concern with the value of wilderness as a place of value beyond the sphere of human intervention. For Nietzsche, wild nature is a realm where moral valuations are out of order. In his work, however, we can discern a paradoxical moral concern with this wildness. Wildness is a critical moral concept that reminds us of the fact that our moral world of human meanings and goals ultimately rests on a much grander, all-encompassing natural world. Nietzsche's concept of wildness acknowledges the value of that which cannot be morally appropriated. Wild nature confronts us with the limits of human valuing. Wildness as a concept thus introduces the "beyond" of culture into the cultural arena of values.

Dretske, Fred, "Machines, Plants and Animals: The Origins of Agency," *Erkenntnis* 51(1999):19-31. This is a theme issue of *Erkenntnis* on "Animal Minds." (v10,#4)

Drexler, Madeline, *Secret Agents: The Menace of Emerging Infections*. Washington, DC: Joseph Henry (National Academy), 2002. We are under siege from microbes, germs invade our bodies. "The most ceaselessly creative bioterrorist is still Mother Nature. And her microbial operatives are still around us, thriving in the shadows, ready to pounce when conditions are right" (dust jacket). Militaristic metaphors abound in an otherwise well-organized and detailed account. And there is genuine concern for emerging diseases, partly from their rapid transportation in modern societies, partly from their evolving of resistance to drugs.

But the relation between humans and microbes is much more subtle, and the metaphor needs analysis. Tony McMichael, in a review in *Science*, concedes "the ecological imperatives that microbes, like all other species, display. Though the unplanned hit-or-miss processes of biological evolution, microbes often take advantage of changes in human ecology: meat-eating, livestock herding, urban living, storing of food, transfusing of blood, and so on." But "it's time to stop the war metaphor." "This

perspective maligns microbial intent. ... Mother Nature does not deliberately brew bioweapons. Rather, we humans are only one species among countless millions on Earth, and most of those millions are microbes. ... 90% of the cells in our body are bacteria, many of which pay for their board by rendering useful biological support services. Without microbes, we could not ferment the fibrous component of our morning muesli, and cows could not eat grass, and termites could not chew wood. If we are to achieve a new equilibrium with an increasingly globalized microbial world, then we must think in terms of ecological balance, not ambush and arms race." Review in Science 295 (22 February 2002):1469. (v.13,#2)

Drolette, Dan, "Wide Use of Rabbit Virus Is Good News for Native Species," Science 275(1997):154. A virus deliberately and recently released is having dramatic results killing Australia's introduced European rabbits. Showy groundsel has returned, and, unexpectedly, the numbers of western grey kangaroos are increasing. A dozen rabbits were released in the 1840's and now there are 300 million. The response in recovered vegetation is impressive. A virus introduced in the 1950's lost its effectiveness. Some fear the virus may jump species, but there is no evidence of this so far. Feral cats, also a pest, which fed on the rabbits, may also have been reduced, and it does not seem that the cats are switching prey to native species. (v8,#1)

Drucker, Claudia. "Hannah Arendt on the Need for a Public Debate on Science." Environmental Ethics 20(1998):305-16. I discuss Arendt's claim that science and its uses should become a matter of political discussion. The suggestion that science can be discussed and monitored by lay people is based on her interpretation of modern science. Modern science results from a flight from the human condition, which in her view should be reversed by means of the public debate. I conclude that Arendt's political approach should in fact be called a moral approach. Arendt's arguments can be reduced to a traditional humanistic critique of science, interpreted as a version of Kant's antinomy between the cognitive and the moral

interests of reason, according to which scientists must be prevented from treating human beings as a natural species like any other. Drucker is in philosophy, Universidade de Brasilia, Brasilia, Brazil. (EE)

Drucker, Merrit P. "The Military Commander's Responsibility for the Environment." Environmental Ethics 11(1989):135-52. I argue that military commanders have professional responsibilities for the environment in both peace and war. Peacetime responsibilities arise out of the commander's general responsibilities as an agent of the state. Wartime responsibilities are part of the commander's responsibility to protect noncombatants and to protect an environment that is the inherently valuable heritage of mankind. Commanders must assume some risk to protect the environment. I conclude that we must stop not only the environmental damage caused by war, but also war itself if we are to remain a viable species. Drucker is a major in the U.S. Army. (EE)

Drucker, Merrit. P., "The Military Commander's Responsibility for the Environment," Environmental Ethics 11(1989):135-152. A familiar discussion of utility vs. inherent worth of the environment, but in a totally unique context for environmental ethics. The comparison is made between the environment and artwork, and the military's responsibility to protect both, even at the risk of human life (as happened in World War II). Drucker is a Major in the United States Army and has taught philosophy at West Point. (Katz, Bibl # 2)

Drury, Jr., William Holland (1921-1992). Chance and Change: Ecology for Conservationists. Edited by John G. T. Anderson. Berkeley: University of California Press, 1998. 223 pages. \$ 25. Most of the environmental movement has ignored or rejected the changes in thinking that have infiltrated ecological theory since the 1970's. Disorder is what makes the natural world work, and clinging to the romantic notion of nature's grand design only saps the strength of the conservation movement. Humans tend to impose more structure and order on landscapes, when they interpret them, than is in fact there. What is actually there is a vital and dynamic collection of organisms, each with its own strengths and weaknesses, each selected over vast periods of time to do as well as possible under a conflicting array of changes. Evolution can involve a tendency toward greater and greater liberation from environmental constraints, including other organisms, rather than the ever-stronger dependencies proposed by community ecologists. Natural selection is not so much bleak in extreme, "nature red in tooth and claw," as a source of continuous hope and possibility. Drury, an ornithologist and botanist, taught biology at the College of the Atlantic, Bar Harbor, Maine. (v.9,#3)

New York: Oxford University Press, 2003. The end of the green social movement is a transformation of the state and society on a par with earlier transformations that gave us first the liberal capitalist state and then the welfare state. Such a transformation is now most likely in Germany, and least likely in the United States, which has lost the status of environmental pioneer that it gained in the early 1970's. Dryzek is at Australian National University. (v.14, #4)

Dryzek, John S., The Politics of the Earth: Environmental Discourses. Oxford, UK, and New York: Oxford University Press, 1997. 220 pages. An analysis of the main discourses that have dominated

environmental affairs during the last three decades. Dryzek, John S., Rational Ecology: Environment and Political Economy. New York: Basil Blackwell, 1987. Pp. x, 270. A work in political theory rather than environmental philosophy, this book concerns the analysis of "social choice mechanisms"---the "means through which a society ...determines collective outcomes" (p.7). Dryzek develops a concept of "ecological rationality," the ability of human and natural systems to deal with environmental problems, and then applies this to mechanisms of social choice to produce a more enlightened model of decision-making. One result is the need to incorporate "practical reason"---i.e., consideration of ends---into social choice mechanisms. (Katz, Bibl # 2)

Dryzek, John, "Green Reason: Communicative Ethics for the Biosphere," Environmental Ethics 12(1990):195-210. Dryzek argues that the current criticism of instrumental rationality by environmental philosophers is justifiable, but that the adoption of an alternative conception of "ecological spirituality" as a replacement for rationality is a mistake. He suggests the development of a rationality based on the "communicative" model developed by the Frankfurt school. This is a subtle and provocative argument with good criticisms of the standard positions in environmental ethics. Dryzek's proposals for the development of "green reason" are admittedly sketchy, and seem to be based too much on a Gaia-like hypothesis, in which the Earth is seen as an agent. (Katz, Bibl # 2)

Dryzek, John S. "Green Reason: Communicative Ethics for the Biosphere." Environmental Ethics 12(1990):195-210. Exclusively instrumental notions of rationality not only reinforce attitudes conducive to the destruction of the natural world, but also undermine attempts to construct environmental ethics that involve more harmonious relationships between humans and nature. Deep ecologists and other ecological critics of instrumental rationality generally prefer some kind of spiritual orientation to nature. In this paper I argue against both instrumental rationalists and ecological spiritualists in favor of a communicative rationality which encompasses the natural world. I draw upon both critical theory and recent scientific intimations of agency in nature. Dryzek is in the department of Political Science, University of Oregon, Eugene, OR. (EE)

Duerr, William A., "Forestry's Upheaval," Journal of Forestry 84 (no. 1, January 1986):20-26. Advances in Western civilization are redefining the profession. "What matters is not biological but social renewability. ... The public forest preserved from logging is timber used up, just as really as though the land had been cleared and paved with asphalt." In the future, "in recreation, emphasis on wilderness will be softened in favor of less elitist resources." Duerr was Distinguished Professor of Forestry, State University of New York, Syracuse, and has more recently been at Virginia Tech, Blacksburg. (v3,#1)

Duffin, Stephen J. "The Environmental Views of John Locke and the Maori People of New Zealand." Environmental Ethics 26(2004):381-401. In recent years, the trend in environmental ethics has been to criticize the traditional Western anthropocentric attitude toward nature. Many environmentalists have looked toward some of the views held by indigenous peoples in various parts of the world and argue that important ecological lessons can be learned by studying their beliefs and attitudes toward nature. The traditional Western viewpoint has been labeled as a form of shallow environmentalism, allowing few rights for anything other than human life. In contrast, indigenous peoples are seen as respecting all things. Thus, the claim is made that the latter's ecological views are deeper than those of Western views. John Locke is often placed at the center of this tradition that is associated with indifference to the environment. Yet, a comparison of the fundamental beliefs that drive the environmental ethics of the Maori people with those of John Locke reveals surprising similarities. It may well be the case that any adoption by the West of another culture's view would be too difficult given that there are so many foundational beliefs that are alien to the West, but which are nevertheless required to drive such an ethic. Nevertheless, if we can find similarities between various views, such as those of the Maori and Locke, we may have a greater appreciation of one another's beliefs and hence less reluctance to adopt them if they will benefit the environment. Our efforts could then perhaps be directed toward putting environmental ethics into practice

rather than fighting over which doctrine is the correct one. (EE)

Duffus, David A., and Philip Dearden, "Recreational Use, Valuation, and Management of Killer Whales (*Orcinus orca*) on Canada's Pacific Coast," Environmental Conservation 20 (no. 2, Summer):149-156. Killer whales are among the most spectacular of all animals to see in the wild, and recreational watching of them has increased dramatically. The authors analyze surrounding issues: the experiences people have, economic benefits to communities, possible harassment of the whales, management issues, and whether the Canadian experience can be a model for whale and dolphin watching elsewhere. The authors are in geography at the University of Victoria, British Columbia. (v5,#4)

Duffy, David Cameron and Albert J. Meier, "Do Appalachian Herbaceous Understories Ever Recover from Clearcutting?" Conservation Biology 6(1992):196-201. The answer is no--at least for a very long time. In a study of sites from 45 to 87 years later, the understory was only one-third as abundant as in the original primary forest. This article was featured in a story in the New York Times, "Study Casts Doubt on Belief in Self-Revival of Cleared Forests," by Catherine Dold, September 1, 1992, p. B9. (Thanks to Doug Daigle.) Duke, Lynne, "Limited Trade in Ivory Approved," Washington Post 6/20/97: A16. CITES approves limited trade in ivory. The U.N. Convention on International Trade in Endangered Species (CITES) downgraded the protected status of elephants in three southern African nations, allowing some trade in ivory for the first time in nearly a decade. The ban was put in place in 1989 after rampant poaching had reduced the elephant population by 50% during the 1980s. Since the ban, the African elephant population has grown from 50,000 to 60,000. Zimbabwe, Namibia, and Botswana will use the moneys from selling an annual quota of their ivory stockpile to fund "sustainable use" conservation and development programs in communities affected by the elephant's protected status. The U.S. opposed the lifting of the ban. Reflecting a widespread sentiment, one African official described the decision as "a victory for African sovereignty and their right to the utilization of their natural resources in a sustainable manner without dictation from the industrialized countries." Japan's and Norway's request to lift hunting and trade restrictions on commercial whaling was turned down. For a provocative editorial supporting the lifting of

the ban, see Wendy Marston, "The Misguided Ivory Ban and the Reality of Living with Elephants," Washington Post (6/8/97): C2. (v8,#2)

Duncan, Ian J.H., "Welfare is to do with What Animals Feel", Journal of Agricultural and Environmental Ethics 6(1993), Supplement. Although it is not possible to give the term "welfare" a precise scientific definition, nevertheless it is a useful term which describes a distinct phenomenon. It is argued that it is only appropriate to consider the welfare of sentient animals such as the vertebrates and higher invertebrates. Sentient is defined as "capable of feeling" and the view is expressed that welfare may be all to do with what animals feel. The "pine tree argument" is developed, according to which one questions whether or not the phenomenon suspected of being welfare can be applied sensibly to pine trees; if it can, then it is not welfare. Application of the pine tree argument leads to the conclusion that welfare is not simply health, absence of stress, or biological fitness. It is concluded that welfare is indeed all to do with what animals feel. The consequence of this conclusion is that methods to assess welfare should be aimed at asking animals what they feel about the conditions under which they are kept and the procedures to which they are exposed. Duncan is in the Department of Animal and Poultry Science, University of Guelph, Guelph, Ontario Canada N1G 2W1.

Dundon, Stanislaus J., "Development Aid: The Moral Obligation to Innovation", Journal of Agricultural and Environmental Ethics 4(1991):31-48. The prominent, though not exclusive, role of basic needs strategies to attain ethically acceptable development goals raises the question of the ability of development agencies to find and employ basic needs strategies. The obligation to prevent severe human suffering leads to the obligation to employ basic needs strategies to attain basic needs goals. The history of failure by development agencies in finding and employing basic needs tools leads to a further obligation to cultivate bureaucratic environments which foster profound innovation. This requires not only new tools but also new bureaucratic behaviour. An understandable obstacle to simultaneously technological and bureaucratic innovation lies in the tension between "responsible behaviour" and "behaviour promoting fundamental change." Since this tension is based on the unpredictability of creative change, a series of axioms and corollaries which reduce the unpredictability is given. They include: (1) an obligation to seek innovation; (2) a clear statement of basic needs goals and intent to use some basic needs tools; (3) increase in effective knowledge of the poor and their survival strategies; (4) bureaucratic learning flexibility; (5) participatory development and allied emphasis on sustainable resource technologies. The embodiment of these in the "learning" process approach is illustrated.

Dunlap, Thomas R., "Environmentalism, a Secular Faith," Environmental Values 15(2006):321-330. Much of American environmentalism's passion and political power, as well as shortcomings and tactical failures, have their origin in the movement's demands for new attitudes toward nature as well as new laws and policies. A full understanding of environmentalism requires seeing it as a secular faith, movement concerned with ultimate questions of humans' place and purpose in the world. This perspective explains much about its development, its emphasis on individual action, the vehemence of its opposition, and its political failure in the last generation. Comparisons with other national environmental movements, not considered here, constitute an important topic for further research. (EV)

DuPuis, E. Melanie and Peter Vandergeest, eds., Creating the Countryside: The Politics of Rural and Environmental Discourse. Philadelphia: Temple University Press, 1995. 346 pages. What does it mean to save nature and rural life? Do people know what they are trying to save and what they mean by "save"? As the answers to these questions become more and more unclear, so, too, do the concepts of "environment," "wilderness," and "country." Ten contributors on people in and out of nature, constructing rurality, why people make artificial distinctions between nature and culture, and generally complaints about dualistic categories that limit our ability to think about environmental and rural problems and hamper our ability to formulate practical, realistic, and just solutions. DuPuis is an analyst of environmental policy with the New York State Department of Economic Development. Vandergeest is on the faculty of environmental studies at York University. (v7,#2)

Durland, Karann. "The Prospects for a Viable Biocentric Egalitarianism." *Environmental Ethics* 30(2008):401-416. At a minimum, a satisfactory biocentric egalitarianism must satisfy three constraints: (1) it must demand enough to deserve the name biocentric; (2) it must not require so much that it makes a worthwhile or at least a recognizably human life impossible; and (3) it must not be incoherent or internally inconsistent. Neither rule-based forms of biocentric egalitarianism nor virtue theory versions meet all three requirements. The rule-based accounts that Paul Taylor and James Sterba introduce contain serious defects, and many of these problems appear in any rule-based biocentric egalitarianism, making all such approaches untenable. The egalitarian virtue theories suggested by Albert Schweitzer, Kenneth Goodpaster, and Jason Kawall are too promissory to be useful or fully assessed, but an overlooked virtue-based account that Taylor defends is more detailed and fatally flawed. Since its difficulties appear in any fully developed virtue-ethic version of biocentric egalitarianism, virtue-based approaches fare no better than rule-based ones. Given the problems that both rule-based and virtue theory forms of biocentric egalitarianism face, the prospects for a viable biocentric egalitarianism are bleak. (EE)

Durning, Alan, How Much Is Enough? The Consumer Society and the Future of the Earth. New York: W. W. Norton. \$ 8.95. 200 pages. 1992. The richest one-fifth of humanity causes vastly disproportionate environmental damage because of its growing demand for material goods. The consumption gap between industrialized and developing countries is 18 to 1 for chemicals, 10 to 1 for timber and energy, 3 to 1 for grain and fresh water. Groundwater in the U.S. is being pumped 25 times faster than the normal rate of replenishment. Meanwhile, surveys show there has not been any noticeable increase in personal satisfaction or happiness. (v3,#3)

Durning, Alan B., Apartheid's Environmental Toll. Worldwatch Paper 95. May 1990. 50 pages. \$ 4.00. Worldwatch Institute, 1771 Massachusetts Ave., N. W. Washington, DC 20036. A startling paper. "Apartheid reveals with exceptional clarity the way unfairness within the human estate extends its damage into the natural estate as well." "Forced relocations and natural increase combine to give the homelands an average population density higher than all but three countries on the continent." "Air and water near mining and smelting operations are little monitored, and what monitoring is done is not reported." "Aside from oil exporters and the notoriously inefficient centrally planned economies, South Africa is the most energy-intensive country in the world." "On a per person basis, white South Africans are the world's worst greenhouse offenders." "The bantustan system leaves South Africa with a pattern of land ownership more skewed than any on the seven continents." (v1,#4)

Durrenberger, Robert W., Environment and Man: A Bibliography. Palo Alto, CA: National Press Books, 1970. 118 pages. Paper. 2,225 entries. An older bibliography now mostly of historical interest. Durrenberger is at San Fernando Valley State College.

Dustin, Daniel L., and Leo H. McAvoy. "The Decline and Fall of Quality Recreation Opportunities and Environments?" *Environmental Ethics* 4(1982):49-57. User satisfaction as the ultimate goal of recreation

planning and management is contested by a discussion of human adaptability which makes it possible for people to adjust to a progressively lower quality of recreation opportunities without loss of satisfaction. Recreation planning and management based on such satisfaction levels are then shown to perpetuate a deterioration in the quality of recreation environments themselves. To arrest this trend, a new goal for recreation planning and management is proposed based on the equation of quality of opportunity with diversity of environmental settings. The article concludes with a discussion of this goal in light of the Recreation Opportunity Spectrum (ROS) concept developed recently by members of the U. S. Forest Service. McAvoy is at the Division of Recreation, Park and Leisure Studies, University of Minnesota, Minneapolis, MN. Dustin is in the department of Recreation, San Diego State University, San Diego, CA. (EE)

Dustin, Daniel L., and Leo H. McAvoy. "Hardening National Parks." Environmental Ethics 2(1980):39-44. The "tragedy of the commons" argument developed by Garrett Hardin is applied to problems associated with the increasing use of the national parks in the United States. The relevance of his argument to such problems is illustrated by a discussion of the proposals included in the recent Draft General Management Plan for Yosemite National Park. Implications for the future management of Yosemite and other public recreation resources conclude the article. McAvoy is at the Division of Recreation, Park and Leisure Studies, University of Minnesota, Minneapolis, MN. Dustin is in the department of Recreation, San Diego State University, San Diego, CA. (EE)

Dustin, Daniel L., and Leo H. McAvoy. "Toward Environmental Eolithism." Environmental Ethics 6(1984):161-66. We apply two contrasting principles of human workmanship, the principles of design and eolithism, to the issue of responsible environmental stewardship. Both principles are described and analyzed in an environmental context with an emphasis on the weaknesses of the more popular design principle and the strengths of the lesser known eolithic principle. We conclude with a discussion of the principles' complementary potential for environmental planning and management. McAvoy is at the Division of Recreation, Park and Leisure Studies, University of Minnesota, Minneapolis, MN. Dustin is in the department of Recreation, San Diego State University, San Diego, CA. (EE)

Dustin, Daniel L., and Leo H. McAvoy, "Toward Environmental Eolithism," Environmental Ethics 6(1984):161-166. Eolithism is defined as the process of finding and using "junk." This, the authors argue, rather than a principle of design, should be the guiding metaphor of environmental management. (Katz, Bibl # 1)

Dustin, Daniel L., The Wilderness Within: Journeys in Self-Discovery. San Diego, CA: Institute for Leisure Behavior, San Diego State University. 1993. 153 pages. \$ 6.95. ISBN 1-882708-52-0. Dustin finds that journeys he takes to places "out there" to the exterior world of mountains, forests, deserts, and tundra become journeys he takes "in here" in his interior world. "To me wilderness is the logical place, indeed the ideal place, to marvel at life's unfolding, to live at life's edge. It is in wilderness that we can best discard the protective armor that shields us from life itself. It is in wilderness that we can best get down to earth, that we can best open up and receive the world around us. It is in wilderness that we can best rejoice in the here and now. But the way wilderness is managed these days tends to undermine this opportunity." (p. 5) Thoughtful reflections of interest to those who ask what happens to people in wilderness. Dustin is Distinguished Professor in San Diego State University's Department of Recreation, Parks, and Tourism. (v4,#3)

Duval, R. Shannon, and David Edward Shaner. "Conservation Ethics and the Japanese Intellectual Tradition." Environmental Ethics 11(1989):197-214. A systematic philosophy that presupposes an ecocentric world view, rather than a homocentric or egocentric world view, can be a viable resource for investigating issues in environmental philosophy and conservation ethics. Generally speaking, the Japanese philosophical and religious tradition represents a commitment to ecocentrism. This philosophical orientation is in concert with the world view of many naturalists. We explore one example of ecocentrism by unveiling the crosscultural connection between the naturalistic philosophy of Louis Agassiz, a nineteenth-century French-American biologist, and the early writings of Nishida Kitaro, a twentieth-century Japanese philosopher. We suggest that the central player in understanding the ecocentric connection between Agassiz and Nishida is American philosopher/psychologist William James. James was once a student of Agassiz and his writings influenced Nishida's early work. Related issues concerning conservation ethics and the Japanese intellectual tradition are also addressed. Shaner is at the Philosophy Dept., Furman University, Greenville, SC. Duval is a Dana Foundation Research and Teaching Assistant at Furman University, Greenville, SC. (EE)

Duvick, Donald N. "Biotechnology Is Compatible with Sustainable Agriculture." Journal of Agricultural and Environmental Ethics 8(1995):112-125. Biotechnology can provide appropriate new tools for use in solution of specific problems in sustainable agriculture. Its usefulness will depend in large part on the degree to which sustainable agriculturists understand the utility of biotechnology and apply it toward ends they deem important. Biotechnology can give little assistance to sustainable agriculture in the short term. It can be more useful in the medium term, and it could be highly useful in the long term as an integral part of the art and science of plant breeding and other components of sustainable agriculture systems. Dworkin, Ronald, Life's Dominion: An Argument about Abortion, Euthanasia, and Individual Freedom. New York: Knopf, 1993. Mostly medical bioethics, but Dworkin sometimes ventures into environmental concerns. We have an obligation to protect species that goes beyond our own well-being; we think we should admire and protect them because they are important in themselves, and not just if or because we or others want to enjoy them. "Someone might say: we protect endangered species because we want the pleasure of continuing to see animals of each species, or because we want the useful information we

might gain by studying them, or because it is more interesting for us that there be more rather than fewer species. But none of these arguments rings true. Many--perhaps most--of the people who consider endangered species important ... struggle to protect the species simply because they think it would be a shame if human acts and decisions caused its disappearance. So this is another important example of something many of us take to be of intrinsic rather than instrumental value" (p. 75).

Dworkin, Ronald. Life's Dominion: An Argument about Abortion, Euthanasia, and Individual Freedom. New York: Alfred A. Knopf, 1993. 273 pages. Dworkin's main argument is that debates here are fundamentally religious disagreements, and so he asks, in Chapter 3, "What Is Sacred?" He is led to some reflections on intrinsic value in nature: "In our culture, we tend to treat distinct animal species (though not individual animals) as sacred ... another important example of something many of us take to be of intrinsic rather than instrumental value" (p. 75). "Our concern for the preservation of animal species is also based on respect for the way they came into being rather than for the animals independently of that history. The natural processes of evolution and development themselves have a normative significance for us and this is not because the species they generated--the rhinoceros or the horned owl, for example, are superior on some independent test of animal worth to others that might have evolved if they had not, but because we consider it wrong, a desecration of the inviolable, that a species that evolution did produce should perish through our acts. Geneticists have created plants that we find instrumentally valuable: they produce food and may save lives. But we do not think artificially produced species are intrinsically valuable in the way that naturally produced species are" (pp. 78-79). Dworkin does not undertake to defend this position but rather to recognize it as a plausible and widespread conviction, one that any just law must take into account. Dworkin is professor of law at New York University and at Oxford University. (v6,#1)

Dwyer, Johanna, and Loew, Franklin M., "Nutritional Risks of Vegan Diets to Women and Children: Are They Preventable?", Journal of Agricultural and Environmental Ethics 7(1994):87-110. Women and children are at higher risk of malnutrition from consumption of unsupplemented vegan diets than are adult males. Those who are very young, pregnant, lactating, elderly, or who suffer from poverty, disease or other environmentally induced disadvantages are at special risk. Fortunately, the risk of dietary deficiency disease can be avoided and the potential health benefits of vegan diets can be realized when diets for these groups are planned in line with the Recommended Dietary Allowances so that nutrient intakes reach or exceed recommended levels. Dwyer is in nutrition at the Tufts University Schools of Medicine and Nutrition, New England Medical Center, Boston. Loew is at the Tufts University School of Veterinary Medicine and Tufts Biotechnology Corporation, Boston and North Grafton.

Dwyer, Michael J., Sea of Heartbreak: The Extraordinary Account Of A Newfoundland Fishing Voyage. Toronto, Canada: Key Porter Books, Toronto, Canada, 2001. ISBN 1-55263-303-9. Going fishing for turbot with gill nets is to participate in a marine massacre. Dwyer's personal environmental ethics perhaps might be designated as a form of "progressive anthropocentrism." He is not opposed to killing wildlife for a living, e.g. fishing, or hunting for food, but he signs on board a ship he comes to call "our ship of death" (p. 191), and reaches the conviction that a civilization with such a profligate attitude towards the non-human inhabitants of the marine world does not deserve to survive. Thanks to David Orton. (v.12,#4)

Dwyer, Peter D., "The Invention of Nature," Pages 157-186 in Ellen, Roy, and Fukui, Katsuyoshi, eds., Redefining Nature: Ecology, Culture and Domestication. Oxford, UK: Berg, 1996. "Modern thought treats nature as separate from culture and has assigned ontological priority to the former. This is analogous to the separation of environment and organism that informs much of biology. ... We are easily taught that nature is other than culture or that environment is other than organism; that cultures, like

organisms, are emergent products. These understandings mesh comfortably with a tradition of thought that, for more than a century, has been underlain by an evolutionary perspective. I wish to revise, and to some extent up-end this tradition. ... I shall argue, in the domain of human affairs [that] culture should be taken as prior, nature as emergent. The sad truth may be that the idea of 'wilderness' -- that supposed last refuge of nature--is no more than an attempt to represent an imaginary place as a concrete symbol. 'Nature' as Westerners know it is an invention, an artefact" (p. 157). Dwyer is a zoologist at the University of Queensland, Brisbane, with anthropological interests in subsistence peoples in Papua New Guinea. (v.13,#1)

Earley, Lawrence S., "Disturbing News for Wildlife," Wildlife in North Carolina 64 (no. 9, September

2000):12-19. Part I. "A Case for Management," 64 (no. 10, October 2000):14-19. Part II. As North Carolina's mountain forests age, many wildlife species have been left without habitat. A scarcity of early successional habitat is having detrimental effects on many wildlife species--bobwhite quail, indigo buntings, prairie warblers, towhees, yellow-breasted chats, and cottontail rabbits. North Carolina formerly had such habitats, by some accounts as a result of logging, or, earlier, of Indian fires, by others accounts up to a quarter of the forests were naturally early succession as a result of storms and natural fires. One habitat of particular interest is the "balds" (grassy areas without forests) on over forty of the high Appalachians. What caused these areas is unknown, but they are now disappearing. Prescribed fire is only part of the answer. Elk are being reintroduced to the Great Smoky Mountains to restore grazing. Some now argue that more forests need to be cut to re-create this habitat, but environmentalists wonder. Managers face a dilemma: "We seek to conserve a natural world that must change and we often interject human management into ecosystems that we would ideally like to see human free" (Part II, p. 16). (v.11,#3)

Earp, David J. "The Regulation of Genetically Engineered Plants: Is Peter Rabbit Safe in Mr. McGregor's Transgenic Vegetable Patch?" Environmental Law 24 (no. 4, 1994): 1663- . Recent changes in federal regulations of genetically engineered plants, with a conclusion that they generally provide adequate environmental protection but, because the science is outpacing the laws, the Department of Agriculture needs additional statutory authority to prevent all risks. (v6,#1)

Earth Ethics is a recently launched periodical in environmental ethics, published by the Public Resource Foundation, 1815 H Street, NW, Suite 600, Washington, DC 20006. There is no fixed subscription price; a contribution of \$ 10 or more is encouraged. The format is short articles and brief notes, around the theme of evolving values for an Earth community. Sara Ebenreck is editor, to whom editorial correspondence should be directed, 3451 Sixes Road, Prince Frederick, MD 20678. (v1,#2)

Earth Ethics, vol. 8, nos. 2-3, Winter/Spring 1997, contains several articles on the proposed UN Earth Charter:

--"The Earth Charter, Benchmark Draft"

--Rockefeller, Steven C., "The Earth Charter Process"

--Clugston, Richard M., "A Common Ground for Global Earth Ethics?"

--Jaaffar, Mehdi Ahmed, "The Earth Charter--The Oman Report" (a report from the Sultanate of Oman)

--Burford, Grace, Sallie King, Paul Knittier, and Jay McDaniel, "A Buddhist-Christian Contribution to the Earth Charter" (two authors are Buddhists; two are Christians)

--Dwivedi, O. P., "India's Heritage of Environmental Stewardship"

and a forum with contributions by Vaclav Havel, Brendon Mackey, David McCloskey, also excerpts from the report of a working group of the Commission on Sustainable Development.

There is also a section on "Common Critiques of the Earth Charter," and response. The critiques are:

1. The Earth Charter is a norther, environmental document that does not take into account the realities of the global south.
2. The Earth Charter's romantic animism and "new age" thinking are not defensible scientifically, despite repeated historical attempts to assert an organicist or vitalist world view.
3. The Earth Charter is a step backward. The language is feeble because it fails to integrate and assert the best language already in place in existing documents, crafted in the nearly endless series of UN Summits, from Rio through Rome.
4. The Earth Charter is not poetic, spiritual or moving enough. Too much has been written by committee, resulting in a hodge-podge of poetry, philosophical musings, and UN bureaucratic language.

All the articles are short and concentrated. The draft Charter and these discussions can make stimulating class materials. (v8,#3)

Earth is a newly launched magazine, by the editors of Astronomy, devoted to the geology and evolution

of the Earth. "Our magazine focuses on the magnificence of our world as a planet ... the Earth. We will explore this ever-changing, vital, awesome body of great force and beauty." -- Robert Burnham, Editor. Address: 21027 Crossroads Circle, P. O. Box 1612, Waukesha, WI 53187-1612. (v2,#1)

Easterbrook, Greg, "Greenhouse Common Sense: Why Global Warming Economics Matter More than Science," U.S. News and World Report, December 1, 1997, pp. 58-62. More than 2,500 economists, including eight Nobel prizewinners, endorsed a statement by the organization Redefining Progress saying that "sound economic analysis" shows that greenhouse emissions can be cut "without harming American living standards." Easterbrook remains rather much of a free market environmentalist. (v.8,#4)

Easterbrook, Gregg, A Moment on the Earth: The Coming Age of Environmental Optimism. New York: Viking, 1995. 745 pages. \$27.95. It's been only 25 years since the first Earth Day. Easterbrook argues that the past quarter-century has been nothing short of revolutionary: diminished air pollution, cleaner drinking water than before the first factory was built, hundreds of laws against toxic waste, thousand of towns recycling garbage, endangered species protected by law, littering and smoking--very recently common in America--are now both despised. Although environmentalists are often pessimists, Easterbrook gives them a pat on the back. In a review in The New York Times Book Review (April 23, 1995, p. 13), Michael Specter predicts that Easterbrook's book will be hated by "the liberal ideologues of the environmental movement" and praised by those peddling the Contract with America. The book is poorly documented, Specter points out. "One of the most pernicious documents to claim itself as green in quite some time." - Tom Athanasiou, review in Environmental Action, Fall 1995, p. 27. Reviewed by Calvin B. DeWitt in Christian Century, November 22-29, 1995: Easterbrook is full of errors and misrepresentations. "Easterbrook tells us it's time to reconcile environmentalism with the facts, but he

doesn't practice what he preaches." For a contrasting book, published at the same time, see Dowie, Mark, Losing Ground. Easterbrook has written on environmental issues for Newsweek, The New Republic, and other publications. (v6,#2)

Easton, Thomas A., ed., Taking Sides: Clashing Views on Controversial Environmental Issues, 10th edition. New York: McGraw Hill, Dushkin, 2003. Eaton, David, "Incorporating the other: Val Plumwood's integration of ethical frameworks," Ethics and the Environment 7(no. 2, 2002):153-180. Val Plumwood's recent attempt to formulate a "contextual" theory of vegetarianism that integrates concern for animals, ecology, and unprivileged societies involves heavy criticism of Carol J. Adams. Plumwood's theory, although claiming to be "contextual," involves an unnecessary degree of abstraction both in its engagement with Adams's thought and in its attempt to formulate a universal narrative. Plumwood consistently misrepresents Adams's work and demonstrates an alignment with dominant discourses that favor "meat." By representing the rejection of these discourses as alienated and deviant, Plumwood risks muting the radical critique that western vegetarianism represents and absorbing it within the exploitative dominant viewpoint. (E&E)

Eaton, Heather and Lorentzen, Lois Ann, eds. Ecofeminism and Globalization: Exploring Culture, Context, and Religion. Rowman & Littlefield. 2003. Eleven essays in three sections: I. Economic Globalization, the Environment and Gender - two theoretical essays by Mary Mellor and Heather Eaton; II Challenges to Ecofeminism: Concrete Cases - essays from Kenya, Chiapas, Mexico, and India challenge ecofeminist principles (authors Celia Nyamweru, Lois Lorentzen and Aruna Gnanadason; and III. Regional and Transnational Expression of Ecofeminism and Responses to Globalization. Articles by Noel Sturgeon, wan-Li Ho, Mary Judith Ress, Ivone Gebara, Masatsugu Maruyama and Greta Gaard. Lorentzen is in social ethics, University of San Francisco.

Eaton, Randall L., The Sacred Hunt: Hunting as a Sacred Path. Ashland, OR: Sacred Press, 1998. (Sacred Press, P. O. Box 490, Ashland, OR 97520). 206 pages. \$ 25.00. About forty short topical essays,

forcefully written. Our human roots as hunters. The significance of hunting in being human and in understanding one's relation to the world. Samples: "The Human Carnivore," "The Deer I Never Killed," "Trophy Hunting and Planetary Dominion."

On Tom Regan: "Regan doesn't know where in 'the great chain of being' animal rights begin or end. ... Regan is a confused idealist whose animal rights would separate humanity from the animals and nature. There is nothing moral in his animal rights, no sacredness. Just more bombastic intellectualism, more hubris. I doubt that neither Tom Regan nor moral philosophy in general will lead us home. Moral philosophy is anachronistic, save the here-and-now listening to the heart. Let me tell you a secret from one of my students: 'Everybody is someone else's dinner.' ... Here is a simple truth. To live is to kill and to die. To live well is to kill and die well, to make sacred. Our first ethic for nature is to surrender our own hearts" (pp. 148-149). Well, too bad, Tom, but at least nature is still sacred--for these carnivorous hunters. Eaton is an animal behaviorist, long the editor of the journal Carnivore, and has appeared on national television in defense of hunting. There is also a set of two related videos: The Sacred Hunt I and II. (v.9,#4)

Ebenreck, Sara, Review of Carolyn Merchant, Earthcare. Environmental Ethics 19(1997):323-325. (EE)

Ebenreck, Sara, "Opening Pandora's Box: The Role of Imagination in Environmental Ethics," Environmental Ethics 18(1996):3-18. While the activity of imagination is present in much writing about environmental ethics, little direct attention has been given to clarifying its role. Both its significant presence and provocative theoretical work showing the central role of imagination in ethics suggest a need for discussion of its contributions. Environmental ethicists especially should attend to imagination because of the pervasive influence of metaphorical constructs of nature and because imaginative work is required to even partially envision the perspective of a nonhuman being. Without clear awareness of the limits of contemporary Western metaphoric constructs of nature, environmental ethicists may overlook or even contribute to the cultural extinction of ideas of nature present in the imaginative visions of indigenous cultures. In this article, I briefly review the reasons why the dominant Western philosophical tradition ranks imagination below the power of abstract reasoning, survey contemporary ideas about the role of imagination in ethics, and consider the implications of these ideas for environmental ethics. The work of imaginative empathy in constructing what might be the experience of nonhuman beings, the role of diverse metaphors and symbols in understanding nature, and the process of envisioning the possible future are developed as three central contributions of imagination to environmental ethics. Imaginative work is not peripheral, but complementary to the work of reason in shaping an environmental ethic. Ebenreck teaches philosophy at St. Mary's College of Maryland. (EE)

Ebenreck, Sara, "A Partnership Farmland Ethic," Environmental Ethics 5(1983):33-45. By focusing on the agricultural use of land, Ebenreck discusses the problems with a stewardship ethic of natural resources, and instead urges a "partnership" ethic; this involves respecting nature, not destroying it, and returning something to the land as an exchange for the use by humans. (Katz, Bibl # 1)

Ebenreck, Sara. Review of Ecofeminism as Politics: Nature, Marx and the Postmodern. By Ariel Salleh. Environmental Ethics 21(1999):437-440.

Ebenreck, Sara. "A Partnership Farmland Ethic." Environmental Ethics 5(1983):33-45. Current facts about soil erosion, groundwater "mining," and impact of toxic substances suggest a resource crisis in our farming system. Yet traditional checks on the exploitation of farmland, capsulized in the "stewardship ethic," proceed from too limited a viewpoint to adequately address the root of the exploitation and proffer an alternative. After briefly examining the stewardship ethic, I consider the development of a "partnership ethic" to guide the use of land for farming which builds its essential elements out of the reflections of feminist thinkers on the relationship between humankind and nature. Instead of using "rights" language to express the ethic, I develop a theory of appropriate use analogous to the appropriate

use of another person's capabilities--i.e., that such moral use should respect and not destroy the other and that it should return something of value to the other in exchange for the use. Finally, those principles are examined for their practical implications for farmland use and national farm policy. Ebenreck is a food and agricultural policy consultant, Washington, D.C. (EE)

Echeverria, John, and Raymond Booth Eby, eds. Let the People Judge: Wise Use and the Private Property Rights Movement. Washington, DC: Island Press, 1995. 369 pages, hard and soft cover. Wise Use and related organizations are difficult to characterize in terms of either membership or goals, but they share certain tactics. In general Wise Use supporters attack environmental protection and conservation efforts as harmful to the economy and job creation, insensitive to the needs and desires of local communities, and inconsistent with certain traditional American values, including constitutionally protected property rights. There is an alliance between small landowners but the movement is often funded and organized by corporations with an interest in preventing further environmental gains. There is also a serious call to work toward solutions to resource conflicts in cooperation with local communities and citizens. This volume collects a wide range of different and sometimes divergent articles on the Wise Use movement. Samples: Thomas Lewis, "Cloaked in a Wise Disguise"; Philip Brick, "Taking Back the Rural West"; John D. Echeverria, "The Takings Issue"; Mary Ann Glendon, "'Absolute' Rights: Property and Privacy"; Holmes Rolston, III, "Winning and Losing in Environmental Ethics"; Teresa Erikson, "Finding the Ties that Bind: Coalitions with Agriculture Groups"; and many others. Thirty-five articles. Escheverria is chief legal counsel for the National Audubon Society; Eby is a graduate student, St. John's College, Annapolis, MD. (v6,#1)

Eckersley, Robin. "Ecological Intervention: Prospects and Limits." *Ethics & International Affairs* Vol. 21, no. 3 (2007): 293-316. This essay seeks to extend the already controversial debate about humanitarian intervention by exploring the morality, legality, and legitimacy of ecological intervention and its corollary, ecological defense. If the legacy of the Holocaust was acceptance of a new category of "crimes against humanity" and an emerging norm of humanitarian intervention, then should the willful or reckless perpetration of mass extinctions and massive ecosystem destruction be regarded as "crimes against nature" or "ecocide" such as to ground a new norm of ecological intervention or ecological defense? *Ethics & International Affairs* features an online symposium of replies to Eckersley at: <<http://www.cceia.org/resources/journal/index.html>>.

Eckersley, Robyn, Review of Benton, Ted Natural Relations., "Natural Justice: From Abstract Rights to Contextualised Needs." Environmental Values 3 (1994):161-172. (EV)

Eckersley, Robyn, "Free Market Environmentalism: Friend or Foe?", Environmental Politics 2(1993):1-19. "Free market environmentalism" proposes that environmental problems can be solved by creating and enforcing tradeable property rights in respect of common environmental assets. But while the market can allocate resources efficiently, it cannot by itself perform the task of setting an optimal (in the sense of just) distribution of income nor an optimal (in the sense of sustainable scale) of the economy relative to the ecosystem. There are certain specific environmental problems where "free market environmentalism" may prove to be the most appropriate solution (it can, for example, promote energy efficiency through market mechanisms), but it is inappropriate as a blanket solution to the ecological crisis. This calls for economic policies concerned with three broad goals: economic efficiency, social justice and ecological sustainability. Eckersley is in politics at Monash University, Australia. A useful response by Michael Jacobs (University of Lancaster, UK) is in the Winter 1993 issue, vol. 2, no. 4. (v5,#4)

Eckersley, Robyn, "Beyond Human Racism," Environmental Values (1998): 165-182. In 'Non-

Anthropocentrism? A Killing Objection', Tony Lynch and David Wells argue that any attempt to develop a non-anthropocentric morality must invariably slide back to either anthropocentrism (either weak or strong) or a highly repugnant misanthropy in cases of direct conflict between the survival needs of humans and nonhuman species. This reply argues that their attempt to expose the flaws in non-anthropocentrism deflects attention away from the crux of the ecocentric critique, which can best be understood if we replace the confusing terms anthropocentrism/non-anthropocentrism with 'human racism'/ecocentrism (understood as a more inclusive moral perspective which encompasses nonracist humanism). Human racism manifests when a reconciliation of human and nonhuman needs is possible but is nonetheless concealed and/or denied. That is, the best test for discerning prejudice against nonhuman nature is not when individual or social choice are severely circumscribed but rather when such choices are relatively unconstrained. Moreover, their concluding argument that human concern for nonhuman nature should be understood in terms of aesthetic values rather than moral values does not provide reliable grounds for the systematic protection of nonhuman nature. KEYWORDS: anthropocentrism, human racism, ecocentrism, hierarchy of needs, deep ecology. Robyn Eckersley is at Monash University, Melbourne, Australia. (EV)

Eckersley, Robyn, "Divining Evolution: The Ecological Ethics of Murray Bookchin," Environmental Ethics 11(1989):99-116. A clear account of the merits and defects of Bookchin's ecological ethics. Although Bookchin is correct in tying his ethics to a comprehensive synthesis of biological and political realities, he makes two crucial mistakes: (1) he claims that his ethics and philosophy of nature is objectively correct, since it is based on the evolutionary potential of all natural entities; (2) this leads to the idea that humanity in its subjectivity is the highest expression of evolution; humanity should direct nature to reach its highest potential for freedom for all beings. Eckersley shows that this optimism is impossible, since human knowledge is inadequate for the control of nature. The best course is to act in harmony and respect with natural processes. Bookchin's criticism of deep ecology is based on an extreme interpretation of biological egalitarianism. (Katz, Bibl # 2)

Eckersley, Robyn. "Divining Evolution: The Ecological Ethics of Murray Bookchin." Environmental

Ethics 11(1989):99-116. I provide an exposition and critique of the ecological ethics of Murray Bookchin. First, I show how Bookchin draws on ecology and evolutionary biology to produce a mutually constraining cluster of ethical guidelines to underpin and justify his vision of a nonhierarchical, ecological society. I then critically examine Bookchin's method of justification and the normative consequences that flow from his position. I argue that Bookchin's enticing promise that his ecological ethics offers the widest realm of freedom to all life forms is undermined by the way in which he distinguishes and privileges second nature (the human realm) over first nature (the nonhuman realm). I conclude that Bookchin's promise can only be delivered by a biocentric philosophy (which he rejects) rather than by his own ecological ethics. Ecologist. The has a special issue on deep ecology, vol. 18, nos. 4/5, 1988. Articles: Grover Foley, "Deep Ecology and Subjectivity"; Henryk Skolimowski, "Eco-philosophy and Deep Ecology"; Arne Naess, "Deep Ecology and Ultimate Premises"; Brian Tokar, "Social Ecology, Deep Ecology and the Future of Green Political Thought"; Robyn Eckersley, "The Road to Ecotopia? Socialism vs. Environmentalism"; Richard Sylvan and David Bennett, "Taoism and Deep Ecology"; and Edward Goldsmith, "The Way: An

Ecological Worldview."

Ecologist, The, a British and European journal since 1969, based in Cornwall, England, will now also be distributed in the United States and Canada by MIT Press. (v1,#1)

Ecologist, The Vol. 18, nos. 4/5 (1988). "Rethinking Man and Nature: Towards an Ecological Worldview." This is a special issue on "deep ecology" with criticisms by Grover Foley, "Deep Ecology and Subjectivity," and Henryk Skolimowski, "Eco-philosophy and Deep Ecology." There is a reply by Arne Naess, "Deep Ecology and Ultimate Premises." Foley argues that deep ecology is a mystical view that avoids the need to control science, technology, and power. Skolimowski argues that deep ecology is not deep enough, for it lacks a unifying cosmology and sense of human destiny. Naess replies that these critics wish to view deep ecology as a definitive philosophical doctrine, but it is more a platform of generally agreed common principles, without a unitary foundation. Also in the issue: Brian Tokar, "Social Ecology, Deep Ecology, and the Future of Green Political Thought," provides an objective look at the debate between the followers of Bookchin and the deep ecologists. Robyn Eckersley, "The Road to Ecotopia? Socialism Vs. Environmentalism," argues for the incompatibility of socialism and the green movement. Richard Sylvan and David Bennett, "Taoism and Deep Ecology," suggest that Taoism's emphasis on natural living---following "the way"---can help to articulate practical principles for deep ecology. The editor of The Ecologist, Edward Goldsmith, provides a list of 67 principles as the basis for a new world-view to preserve the biosphere. (Katz, Bibl # 2)

Ecology of Industrial Regions is an international journal, founded in 1994 by the V. Vinnichenko International Foundation. Articles are invited covering ecological problems of industrial regions in the broadest sense, including zoological, botanical, medical, geographic, economical, ethical, philosophical and other aspects. Edelstein, Michael R., Makofske, Willaim J. Radon's Deadly Daughters: Science, Environmental Policy and Politics of Risk. Lanham, MD: Rowman and Littlefield Publishers, Inc., 1997. 320 pp. \$21.95 paper, \$62.50 paper. The complex mix of social and scientific factors that have led to public and official misunderstanding of the geologic radon issue and how risk factors are surrounded by mythic beliefs that contradict scientific realities. Public perception of risk may fail to be motivated even by serious threats and the political and scientific influences behind environmental policy can seriously undermine an effective response. Eden, S. Environmental Issues and Business: Implications of a Changing Agenda. Chichester, U.K.: John Wiley and Sons, 1996. 200 pp. £ 25. cloth. Details the dimensions of the business response to environmental issues by taking a critical interdisciplinary social science perspective. Eden catalogues the pressures put upon businesses to take up environmental responsibilities, and then assesses those activities in terms of company culture, communication, and influence on the environmental agenda. The author examines the diversity of business activities and the statutory environmental legislation to which they are subject and evaluates the impact of these activities according to policy developments and the restoration of public confidence. Eder, Klaus, The Social Construction of Nature: A Sociology of Ecological Enlightenment. London: Sage, 1996. 231 pages. £ 14, paper. Eder is embedded in contemporary German social theory, under the influence of Habermas's neo-Marxism and the neo-functionalism of Niklas Luhmann.. He focuses on the symbolic appropriation of nature in various cultural systems. Western thought has concentrated on "labour" seeing nature from a utilitarian perspective and with an instrumental rationality. This instrumentalism is frequently the focus of radical environmentalist critiques. The products of labour are consumed. Our consumptive patters and preferences are not preordained by human needs, as naturalists might hold, but are culturally constructed and symbolically mediated. We use nature to make social distinctions. "People separate themselves according to culturally determined interactions with nature" (p. 21). Eder wants to make a series of cognitive, normative and symbolic corrections to historical materialism. We now belong to "a society that no longer allows for authoritative statements that found rationality on the idea of objectivity in dealing with nature" (p. 203). Eder holds a two cultures perspective in which he regards radical environmentalism as incommensurable with a dominant cultural codes. (v9,#1)

Eder, Klaus, The Social Construction of Nature: A Sociology of Ecological Enlightenment. London and Thousand Oaks, CA: Sage, 1996. \$ 25.00 paper. \$ 82.00 cloth. "The relationship between nature and society can be conceived of in two mutually exclusive ways: as a natural constitution of society or as a social construction of nature" (p. 7). There is either a "natural history of society" or a "social history of nature" (p. 19). Modern, industrial societies have become increasingly destructive of nature, because they see nature as object. Other cultures socially construct nature using symbolism, taboo, and ritual. Nature is always socially constructed; there is an inevitable pluralism of views about nature, though some can be more socially functional than others. Eder is at Humboldt University, Berlin, and European University, Florence. (v.9,#3)

Edmondson, W. T., The Uses of Ecology: Lake Washington and Beyond (Seattle: University of Washington Press, 1991), 312 pages. \$ 19.95. Begins with a case study of Lake Washington, on the eastern edge of the city of Seattle, a success story in conservation, and develops a broad perspective on environmental problems. Shows how basic research is critical for solving and preventing such problems, providing that it is coupled with effective public action. Basic long-term scientific research is the source of knowledge that will allow us to avoid environmental disaster. Edmondson is professor emeritus of zoology at the University of Washington. (v2,#1)

Edwards, Denis, Jesus the Wisdom of God: An Ecological Theology. Maryknoll, NY: Orbis, 1995. \$ 16.95. Edwards is eloquent about Jesus the Sophia of God, a more feminine metaphor that crosschecks Jesus' masculinity and the overly patriarchal tradition, allows more openness to other religious traditions, and, above all, enjoins a more ecological theology--less human dominance and more caring for creation. He waxes eloquent over every Biblical opportunity to interpret Jesus as Sophia, personifying this where he can. Also, this improves the doctrine of the Trinity. God is a sort of community-in-unity, allowing autonomy in the creatures, a more ecological account than the patriarchal monarch. Interesting argument, but not always convincing. Edwards is a Roman Catholic priest from Adelaide, Australia. (v7,#2)
